Immunization against immune serum, E. W. A. Walker (*Jour. Path. and Bact., 8 (1902), No. 1, pp. 34–51*).—The experiments reported in this paper were chiefly concerned with the change induced in bacteria by their growth in immune serum, and the change in the susceptibility of guinea pigs to specific infection due to previous treatment with increasing doses of serum. The immune serum used was the antityphoid serum of Tavel. It was found during the author's experiments that bacteria may be immunized against their immune serum, and may thus be increased in virulence, and become less readily agglutinable. An immune serum in which the corresponding bacillus has been cultivated is thereby rendered less agglutinative and less effective against the bacillus. It was also found that animals may be immunized against immune sera. They are thereby rendered less capable of being protected by that serum, but their susceptibility to the bacterial organism is not increased. Agglutinins are considered true antibodies. The immune body of the same bacterial organism is held to be not identical in different animals, but exhibits especial characters for each species.

Note on toxic and antitoxic action in vitro and in corpore, E. F. Bashford (*Jour. Path. and Bact., 8 (1902), No. 1, pp. 52–69*).—The author's experiments on the protective properties of sera were made largely with reference to the effect of these sera upon corrosive sublimate, saponin, solanin, digitalin, snake venom, ricin, tetanolysin, etc. The experiments were conducted in 2 series, one in vitro and the other in experimental animals, and the results of the 2 series are compared. The author combats the idea that there is any artificially increased protective action in vitro, of the serum of animals immunized against any of these toxic agents, due merely to increase in constituents normally present. The apparent similarity of the reactions obtained in vitro and in experimental animals is briefly discussed by the author, and it is suggested that the protective action of normal serum in vitro be called pseudo-antitoxic in cases where the toxin is incapable of causing the production of the corresponding antitoxin.

Investigations concerning the protective and curative action of anthrax serum obtained from the dog, F. Sanfelice (*Centbl. Bakt. u. Par., 1. Abt., 33 (1902), No. 1, Orig., pp. 61–71*).—While dogs have generally been considered as nearly or quite immune to ordinary infection with anthrax, the author found during numerous experiments that a certain number of dogs were readily infected, while others proved to be quite immune. After repeatedly inoculating dogs with attenuated cultures of anthrax at first and using cultures of greatly increasing virulence, it was found possible to secure a serum from dogs treated in this way which would protect experimental animals against fatal infection with virulent cultures of anthrax.

The destruction of toxins by peroxids and oxydases of animal and vegetable origin, N. Sieber (*Arch. Sci. Biol. [St. Petersburg], 9 (1902), No. 2, pp. 151–170*).—During the extensive investigations undertaken by the author on this subject it was found that calcium dioxid and oxygenated water would destroy the toxins of diphtheria and tetanus. Oxydases of animal and vegetable origin neutralize the toxins of these diseases. The destructive action of oxydases toward toxins manifests itself not only in vitro, but also in the body of the experimental animal, provided the mixture of the toxin and oxydase are injected subcutaneously. The oxydases are capable of exercising their action on small doses of toxins, even when these substances are injected into the animal at different points. It was found that the destruction of toxin by emulsions containing oxydases takes place only when the emulsions give the color reactions which would be characteristic for the oxydases.

The bactericidal action of certain aromatic substances, H. Marx (*Centbl. Bakt. u. Par., 1. Abt., 33 (1902), No. 1, Orig., pp. 74–76*).—Experiments were tried to determine the effect of turpentine oil and nitrobenzol on anthrax bacillus and

Staphylococcus pyogenes aureus. It was found that turpentine oil killed anthrax bacilli when applied in a concentration of 1 to 100 for a period of 60 minutes, while the staphylococci were killed by a concentration of 1 to 10 for the same period. Nitrobenzol, even in a concentration of 1 to 10, did not kill anthrax bacilli or staphylococci within a period of 24 hours.

Morphological changes in the blood during hemolysis, Y. Fukuhara (*Beitr. Path. Anat. u. Allg. Path., 32 (1902), No. 2, pp. 266–275, pl. 1*).—The author studied the microscopic changes in the structure of the red blood corpuscles under the influence of substances which cause hemolysis. The animals from which material was obtained included pigeons, guinea pigs, rabbits, and carp. For producing hemolysis the author used weak solutions of soda (0.2 per cent) and various stains, such as crystal-violet, safranin, and methylene blue. The results of these investigations may be summarized as follows: Small portions of the red blood corpuscles are constricted off during the process of hemolysis; this phenomenon, however, is not especially characteristic of hemolysis, since it also occurs in the coagulation of the blood. The nuclei are set free and the coloring matter of the red corpuscles is gradually dissolved. After the red blood corpuscles lose their hemoglobin, they greatly resemble leucocytes and are distinguished from the latter chiefly by the fact that they become etiolated more rapidly.

The red blood corpuscles and infection, M. Dominici (*Arch. Med. Exper. et Anat. Path., Paris, 1. ser., 14 (1902), No. 6, pp. 681–728*).—An extensive series of experiments was undertaken for the purpose of determining certain details in the behavior of the red blood corpuscles during the progress of infectious diseases in man and animals. The chief purposes of the author were to study the diapedesis and destruction of the red blood corpuscles, the behavior and excessive production of nucleated red blood corpuscles in the bone marrow and in the spleen, and the parallel reactions of the red and white blood corpuscles. The work of other authors on this subject is critically discussed, in connection with bibliographical references. The author infected experimental animals with coli bacillus, typhoid bacillus, and other organisms. It was found that the production of nucleated blood corpuscles in rabbits took place quite rapidly in the peripheral blood vessels at the beginning of septicemic infection. The author was unable to observe any evidence of extensive destruction of the red blood corpuscles in such affections as icterus and hemorrhages. The spleen is believed to be the only organ in which the red blood corpuscles are actually destroyed.

Structure and function of wandering cells, phagocytes, and pus cells, R. Klemensiewicz (*Beitr. Path. Anat. u. Allg. Path., 32 (1902), No. 3, pp. 351–434, pls. 3*).—The investigations reported in this paper were undertaken for the purpose of explaining as far as possible the nature of leucocytes with polymorphous nuclei. The experimental animals were batrachia. The author found that the finely granulated leucocytes with polymorphous nuclei constitute a well-marked group of cells which occur not only as cells in the blood of the organs and larger vessels, but also as pus cells and phagocytes. The structure of the cytoplasm of these cells is characteristic and apparently constant. The author believes that all cells with polymorphus nuclei represent merely one kind of physiological structures which are not so strictly confined in function as are muscle or nerve cells. It is suggested as desirable that certain constant parts of these cells be distinguished by names, such as secretory apparatus, respiratory and excretory organs, motor organs, etc.

Infectiveness of milk of cows which have reacted to the tuberculin test, J. R. Mohler (*U. S. Dept. Agr., Bureau of Animal Industry Bul. 44, pp. 93, pls. 7*).—As a result of the death of a number of cattle from rabies at the Government Asylum for the Insane, St. Elizabeth, D. C., post-mortem examinations were made when it was found that the herd was badly infected with tuberculosis. Twelve animals upon which post-mortem examinations were made were found to be extensively tuber-

culous. Notes are given on the history, care, and stabling of the herd. The animals were fed in the stable throughout the year. The herd consisting of 102 animals, was tested with tuberculin; of this number 76, or 74 per cent, gave a decided reaction; 10 of the animals which showed physical symptoms of tuberculosis also reacted to tuberculin, and of these 10, 5 were found to be unfit for food, while in the other the tuberculous alterations were confined to the lymphatic glands or were otherwise localized. The nonreacting animals were placed in a stable by themselves, after thorough disinfection of the premises, and the tuberculous herd was kept isolated and was cared for by separate attendants.

A series of experiments was made in testing the infectiveness of the milk of reacting animals by feeding and inoculation in guinea pigs. The literature of this subject is critically discussed by the author. In experiments made by the author a sample of milk was taken from each cow daily, the number of cows being 66. The milk was fed to guinea pigs and the centrifugalized cream was inoculated intraabdominally. Cover-glass preparations were also made from the sediment of both the milk and cream and were examined under the microscope after staining. The quantity of milk injected was from 1 to 3 cc. in each guinea pig. In a subsequent examination of the inoculated guinea pigs acid-proof bacteria other than tubercle bacilli were found in only 3 cases. Various other micro-organisms were found in connection with Moeller's grass bacillus. Among the 43 guinea pigs which were used as check animals in the experiments no case of tuberculosis developed. The author gives condensed statistics concerning each cow and the experiments made with her milk. From the feeding and inoculation experiments it was found that the milk of 9 different cows produced fatal tuberculosis when fed to guinea pigs, while the same result was obtained in 13 instances from intraabdominal injection. By combining the results from feeding and inoculation experiments it was found that 12 of the 56 reacting cows, or 21.4 per cent at one time or another gave milk which contained virulent tubercle bacilli. The virulence of the milk increased with the advancement of the disease. The asylum authorities decided to sell the reacting animals as soon as they became dry and thus gradually reduce the herd. After 6 months a second tuberculin test was made; of the 26 cows which were injected, 25 of which had failed to react in a previous test, 8 gave a decided reaction. A third injection 3 months later in 18 cows produced no reaction in any case. The author concludes from these experiments that the tubercle bacillus may be present in the milk of tuberculous cows without an affection of the udder, that tubercle bacilli may be excreted from such animals in sufficient numbers to produce fatal infection in experimental animals. It was found that the number of tubercle bacilli in the milk varies from day to day. The author recommends that "the milk of all cows which have reacted to the tuberculin test should be considered as suspicious and should be subjected to sterilization before using. Still better, tuberculous cows should not be used for general dairy purposes."

Human and bovine tuberculosis, N. Raw (*British Med. Jour., 1903, No. 2196, pp. 247, 248*).—During the past 5 years the author has had under his care 1,750 human patients suffering with various forms of pulmonary tuberculosis and 273 children affected with tabes mesenterica. Post-mortem examination and bacteriological studies were made on a large number of these cases and inoculation experiments were conducted with the material thus obtained. As a result of the author's studies it is concluded that there are 2 distinct varieties of tuberculosis which affect man, one produced by the human tubercle and the other by the bovine tubercle. It is believed that these 2 forms of tuberculosis, while separate and distinct, may both affect man, the true human tuberculosis being usually the pulmonary form and bovine tuberculosis occurring ordinarily as an affection of the mesenteric glands and the alimentary tract. It is believed by the author that true human tuberculosis is always transmitted from one person to another by infection, but that every effort

should be put forth to stamp out tuberculosis in cattle, and that milk and tuberculous products should be sterilized before being eaten.

The transmissibility of human tuberculosis to cattle and goats, A. Moeller (*Deut. Med. Wchnschr., 28 (1902), No. 40, pp. 718, 719*).—The author conducted a number of experiments, during which attempts were made to inoculate calves with human tubercle bacilli by way of the mouth, by intraperitoneal, subcutaneous, and intravenous injections, and by inhalation. Similar methods were used in attempts to inoculate goats. During these experiments it was found to be impossible to infect calves with tubercle bacilli of human origin by any method whatever. The same negative results were obtained from sputum or pure cultures of tubercle bacilli of human origin, whether administered intravenously or given by way of the mouth. Similarly, tubercle bacilli of human origin which had first been passed through goats failed to produce an infection in calves. It was found that enormous quantities of the bacilli could be fed to goats or be inoculated intraperitoneally without producing any infection.

Transmission of tuberculosis of man to cattle, J. Fibiger and C. O. Jensen (*Berlin. Klin. Wchnschr., 39 (1902), No. 38, pp. 881–886*).—Detailed notes are given on the clinical history and post-mortem examination of human tuberculous patients in which there was apparently good evidence of a primary infection of the alimentary tract. Among 12 children who died of tuberculosis and upon whom post-mortem examinations were made a diagnosis was reached indicating primary alimentary tuberculosis in 2 cases. Inoculation experiments were made on calves and cows with material obtained from some of these cases. It was found that the bacilli thus obtained were pathogenic for calves, being in some cases exceedingly virulent. In all, 5 cases of tuberculosis in man furnished material for inoculation of calves, and a great difference in the virulence of the bacilli was noted, ranging from completely nonvirulent to very virulent forms. It was observed that the virulence of the bacilli obtained from these human tuberculous patients varied according to the age of the patients, being gradually weakened in the older patients. The possibility is suggested of an attenuating influence of the human organism which manifests itself in gradually weakening the virulence of tubercle bacilli.

The transmissibility of bovine tuberculosis to man, Köhler (*Deut. Med. Wchnschr., 28 (1902), No. 45, pp. 800–804*).—The recent literature relating to this controversy is critically discussed by the author. It is argued that a majority of cases of tuberculosis in man are due to infection from other human beings rather than from the products of tuberculous animals. The statistics quoted by the author are believed to furnish proof of this proposition. It is not thought desirable, however, to abandon all the safeguards in protecting man from possible infection from animals, but it is urged that the chief attention be given to preventing the spread of tuberculosis from one human being to another.

Tuberculous infection through the alimentary tract, A. Heller (*Deut. Med. Wchnschr., 28 (1902), No. 39, pp. 696, 697*).—Brief notes are given on a number of cases in which man has apparently become infected with tuberculous virus of bovine origin, and statistics are presented showing the proportion of such cases. Detailed notes are given on one case of intestinal tuberculosis in a 13-year-old boy which was believed to be unexplainable except on the basis of infection through tuberculous products. The author states, however, that this case is not unexceptionable, since we must consider that tubercle bacilli of human origin may readily be ingested into the alimentary tract along with filth which may be present on the hands, especially of children.

Inoculation tuberculosis, O. Lassar (*Deut. Med. Wchnschr., 28 (1902), No. 2[illegible], pp. 716–718*).—Among 108,000 patients which came under the attention of the author during the past 10 years, 34 are believed by him to be undoubted cases of inoculation tuberculosis. These cases were chiefly veterinarians, meat stampers, butchers

and meat dealers. Details are given concerning the history of a few of these cases. While among the patients which were examined by the author less than 0.03 per cent were affected with cutaneous tuberculosis, this is believed nevertheless to indicate the comparatively serious danger from infection by bovine tuberculosis in skin wounds.

Pearl disease and human tuberculosis, M. WOLFF (*Deut. Med. Wchnschr., 28 (1902), No. 32, pp. 566–570*).—This article is of a controversial nature. The author argues from the results of experiments and from observations that bovine tuberculosis may be transmitted to man. Detailed notes are given on a case of primary alimentary tuberculosis of man which can only be explained as the result of infection from tuberculous animal products. A number of experiments were made in inoculating animals with material obtained from this and other cases. As a result of these inoculations and post-mortem examinations it is argued that tuberculosis may appear in man and cattle under the same form, and that the 2 diseases are identical. It is urged, therefore, that all measures which have been adopted for preventing the spread of tuberculosis by means of animal products should be rigidly adhered to.

What is pearl disease? J. ORTH (*Berlin. Klin. Wchnschr., 39 (1902), No. 34, pp. 793–798*).—Brief notes are given on the different views which have been held regarding the nature of pearl disease and its relationship to human tuberculosis. A number of experiments were conducted in which experimental animals were inoculated with tuberculous material of human origin and the material obtained from these animals was then used in testing the susceptibility of calves, hogs, and goats. Three of each of these animals were used in the experiments. Among the calves, 2 showed only local changes while 1 exhibited considerable evidence of generalized tuberculosis, including swelling of the mesenteric, portal, and cardiac lymphatic glands. Similar results were obtained with the hogs, of which 2 were only slightly infected, while 1 exhibited considerable tuberculous alterations. All three of the goats became affected with generalized tuberculosis. The author concludes, therefore, that tubercle bacilli of human origin may be so increased in virulence as to become pathogenic for domesticated animals.

Tuberculosis of the transversely striated muscles, S. SALTYKOW (*Centbl. Allg. Path. u. Path. Anat., 13 (1902), No. 18, pp. 715–718*).—A brief review is given of the literature relating to the subject of the behavior of the musculature toward infection with tuberculosis. The author made a number of experiments on rabbits. The animals were inoculated intravenously with tubercle baccilli and the tubercles which developed as a result of this infection were carefully studied with regard to histological details. The muscles were examined at various periods ranging from 2 to 25 days after the inoculation. Detailed notes are given on the histological features and changes observed in the muscles. The tubercles appeared to arise first in the walls of the blood vessels, and were at first formed by the cells of these walls. Later, muscle and other tissues seemed to be concerned in the formation of the tubercles. It was not until 12 days after inoculation that any proliferation of muscle cells could be observed in the neighborhood of the forming tubercles.

Combating bovine tuberculosis in Norway, O. MALM (*Tidsskr. Norske Landbr., 9 (1902), No. 10, pp. 455–467*).—An appropriation was made for the study of the diagnostic value of tuberculin in 1891, and in 1895 systematic work on the problem of bovine tuberculosis in Norway was begun. Extensive tuberculin tests were made between this date and 1901 and the results of these tests were summarized. It was found that the number of infected animals varied from 3.3 to 8.4 per cent. The smallest infestation was found in younger animals, while the more extensive infestation was observed in animals 5 years or more old. It is believed that a successful fight can be waged against the bovine tuberculosis in Norway by means of thorough tuberculin tests and through the cooperation of veterinarians, progressive stock farmers, and officials.—F. W. WOLL.

The question of acclimation to tuberculin, BARTELS (*Deut. Thierärztl. Wchnschr., 10 (1902), No. 29, pp. 285, 286*).—Among 768 steers which had been tested with tuberculin 6 to 7 days previously, 105 reacted, and 97 of these were found to be tuberculous upon post-mortem examination. The author believes that the number of cases which fail to react to tuberculin when tested shortly after a previous injection is much less than has been supposed by some authors. It is believed that where circumstances render it impossible to wait longer in making the test, the second test may be made within 6 to 8 days after the first; the author recommends, however, in all cases where time is not such an important factor that the second test should be made 3 to 4 weeks after the first.

Contribution to von Behring's method of immunizing cattle against tuberculosis, MELDE (*Berlin. Thierärztl. Wchnschr., 1902, No. 40, pp. 593–597*).—The author presents an outline of the immunization method with which von Behring has been experimenting. The method has been extended and is being put into practice on a larger scale. Experiments are being conducted to further perfect methods for securing tuberculin of known strength. In all, about 3,000 cattle have been tested with the Marburg tuberculin, and it has been found that all animals endured this test without any injurious consequences. Various races and ages of cattle have been tested by the tuberculin and have been subjected to vaccination according to von Behring's method. Up to the present time 175 cattle have been immunized in this manner, and as a rule cattle have been chosen for these experiments from tuberculous herds, so that the immunized animals may be exposed to tuberculous ones. It is believed by the author that the method promises to become exceedingly valuable and further reports on the progress of the experiments are promised.

Experimental investigations on the action of dead tubercle bacilli, C. STERNBERG (*Centbl. Allg. Path. u. Path. Anat., 13 (1902), No. 19, pp. 753–778*).—The literature of this subject is critically reviewed by the author. Extensive series of experiments were undertaken for the purpose of determining the effect of the presence of dead tubercle bacilli in animal tissues. Tubercle bacilli were obtained from several sources for use in these experiments, and the material used was previously subjected to different processes. The material came from glycerin-agar cultures, bouillon cultures, and pulverized tubercle bacilli. Later a series of experiments was made to determine whether the toxic principles of tubercle bacilli could be readily extracted by ordinary means so as to render dead tubercle bacilli harmless toward animal tissue. Another series of experiments was undertaken to determine the possibility of immunizing animals by means of tuberculin. As a result of these experiments it was found that dead tubercle bacilli in the animal body were capable of producing essentially the same alterations as living bacilli, although to a less extent. The dead bacilli were found to be capable of killing experimental animals and producing typical tubercles with epithelioid and giant cells. Dead tubercle bacilli could be demonstrated in the animal body for a long time after inoculation and were readily stainable. It is believed, therefore, that the active principle of tubercle bacillus is inherent in the bacterial body and is not removed by persistent and repeated sterilization in living steam, but may be extracted by means of alcohol, ether, and chloroform. It was found that the pathogenic action of tubercle bacillus distinguishes it from all other bacilli otherwise resembling it. It is believed that the necrosis of the lungs in pulmonary tuberculosis of animals and man is partly due to the effect of large quantities of dead tubercle bacilli in such situations. It was found that rabbits could be immunized against the effect of dead tubercle bacilli by repeated injections of tuberculin.

The development of the treatment of parturient paresis during the last five years, J. SCHMIDT (*Berlin. Thierärztl. Wchnschr., 1902, No. 33, pp. 497–503, fig. 1*).—Since the potassic iodid treatment for parturient paresis was introduced by the

author it has been extensively tried in different countries and some of the results of practical experience are brought together in the present article. The author has experimented with pumps for introducing air into the udder in connection with his original treatment. In 140 cases the average length of time between the beginning of treatment and recovery was $6\frac{2}{3}$ hours. It is believed that the use of air hastens recovery in almost all cases. An elaborate discussion is given on the subject of the etiology of this disease. Potassium iodid is known to possess a pronounced antitoxic action and the author believes that the effect of this treatment must be largely due to local action of the chemical in the udder.

On the treatment of parturient paresis, J. SCHMIDT (*Maanedsskr. Dyrlæger, 14 (1902), No. 5, pp. 192–212*).—The author gives a résumé of the literature relating to the treatment of this disease by means of potassic iodid. Notes are also given on the injection of various other substances into the udder, such as warm water, iodin-potassic-iodid, sodium iodid, potassium bromid, etc. It is believed that the most important modification of the potassic iodid treatment which has thus far been proposed is the use of sterilized air. This may be pumped into the udder alone or in combination with and following the potassic-iodid treatment. The chief advantage of the air treatment is that cows recover the normal flow of milk in a comparatively short time.—F. W. WOLL.

Treatment of parturient paresis by iodid of potash, NEVERMANN (*Berlin. Thierärztl. Wchnschr., 1902, No. 27, pp. 402, 403*).—The Schmidt treatment for this disease has given satisfactory results as a rule but the effectiveness of the treatment has been attributed to various factors. It has recently been found that the treatment is rendered more rapidly effective by forcing considerable quantities of pure air into the udder in connection with the infusion of iodid of potash. The author recommends the introduction of air into the udder after the infusion in cases of parturient paresis.

A new treatment of parturient paresis, E. THIERRY (*Jour. Agricole [Paris], 14 (1903), No. 154, pp. 9–15*).—Notes are given on the good results recently obtained from the use of filtered air in connection with potassium iodid as a treatment for parturient paresis. It is believed that this disease will in most cases yield to treatment more rapidly when filtered air is used in addition to potassium iodid.

Parturient paresis before parturition and the theory and treatment of this disease by means of filtered air, A. TEETZ (*Berlin. Thierärztl. Wchnschr., 1902, No. 32, pp. 474–476*).—The author describes a number of cases of this disease which occurred before parturition. Some of the cases were observed before the placenta was loosened, and some of them exhibited an intermittent course. The author believes that parturient paresis is due to excessive anemia of the brain, and that this condition is explained by the unusual flow of blood from other parts of the body to the udder at the beginning of the period of lactation. It is suggested that the introduction of air and the infusion of iodid of potash into the udder might have the effect of forcing out some of the blood from this organ, and thus relieving the cerebral anemia to a certain extent.

Subacute parturient paresis and its treatment with air, A. TEETZ (*Berlin. Thierärztl. Wchnschr., 1902, No. 43, pp. 644, 645*).—The technique of introducing air into the udder is briefly described. In one case of parturient paresis air was pumped into all 4 teats of a cow affected with this disease. Considerable improvement in the condition of the animal was noted within $\frac{1}{4}$ of an hour, and within 5 hours she was able to get up. A rapid recovery followed this treatment.

Simple treatment of parturient paresis, EVERS (*Berlin. Thierärztl. Wchnschr., 1902, No. 32, p. 473, fig. 1*).—The author describes an apparatus devised for introducing pure air into the udder of cows affected with parturient paresis. The apparatus consists of a rubber bulb, a metallic cylinder in which cotton batting may be introduced for filtering impurities out of the air, and a suitable smooth needle connected with rubber tubing.

A new instrument for use in the treatment of parturient paresis. NIEBERMANN (*Berlin. Thierärztl. Wchnschr., 1902, No. 45, pp. 677, 678, fig. 1*).—A business firm in Hanover has devised an instrument which may be used in pumping pure filtered air into the udder of cows affected with this disease, and another simple apparatus has been devised by the same firm for administering the potassium iodid. According to the author the instrument is exceedingly convenient and enables the operator to apply the treatment rapidly.

Foot-and-mouth disease and sulphate of iron. A. BOUCHAUD (*Jour. Agr. Prat., n. ser., 5 (1903), No. 5, pp. 147–152*).—Notes are given on the symptoms and the pathological anatomy of this disease. A number of experiments have been made in the treatment of foot-and-mouth disease with external applications of sulphate of iron. The author repeated these experiments with excellent results. It was found that the spread of the disease could be more effectively checked by this treatment than by any other method. The affected animals were sprayed with a 20 per cent solution of sulphate of iron. The mouth was washed with a 10 per cent solution of the same chemical, and in acute cases a 5 per cent solution was administered internally, to the amount of 2 liters per day for adult animals and 1 liter of a 2 per cent solution for calves. Complete recovery was brought about and the disease was prevented from spreading.

Foot-and-mouth disease and its treatment. G. D'UTRA (*Bol. Agr. São Paulo. 3. ser., 1902, No. 6, pp. 370–374*).—Notes are given on the symptoms and etiology of this disease. The author discusses also the various disinfectants and antiseptic substances which have been used in treating foot-and-mouth disease. Treatment by injections of corrosive sublimate are said to be ineffective.

Study of the diseases included under the name actinomycosis. J. LIGNIÈRES and J. SPITZ (*Bol. Sec. Fomento [Mexico], 2 (1902), Nos. 3, I, pp. 186–200; 4, I, pp. 243–263*).—The authors describe the general symptoms and pathological anatomy of actinomycosis. The disease appears under a number of forms, according to the organs which are chiefly affected. The principal forms are those which affect the skin, tongue, pharynx, glands, udder, viscera, and bones. During 1900 and 1901 the disease prevailed to an unusual extent and with great virulence in Argentina. Notes are given on the toxin produced by the pathogenic organism and on the etiology, treatment and serum therapy of this disease. A bacterial organism was found as the cause of the disease, and the term actinobacillosis is used by the authors.

The action of iodin upon actinomyces. SCHMALTZ (*Berlin. Thierärztl. Wchnschr., 1902, No. 27, pp. 401, 402*).—Attention is called to the difference of opinion which has prevailed between the physicians and veterinarians regarding the effectiveness of iodin treatment in actinomycosis. Brief notes are given on the literature relating to this subject, and an account is presented of an infection with actinomycosis which was suffered by the author. The iodin treatment in this case was ineffective, but a cure was finally brought about by surgical means.

Vaccination for pleuro-pneumonia. LEISTIKOW (*Berlin. Thierärztl. Wchnschr., 1902, No. 29, pp. 437–441*).—The author discusses the great importance of this disease to veterinarians and cattle raisers. Notes are given on the method of vaccination which has proved quite effective in preventing the spread of this disease. The effects of this vaccination has not been scientifically determined. It is purely an empirical method. Vaccination, however, is considered as exceedingly valuable, and it has contributed greatly to the restriction of an outbreak of this disease.

A study of the bacteriology of pyelonephritis of cattle. LIENAUX and ZWAENEPOEL (*Ann. Med. Vet., 51 (1902), No. 9–10, pp. 500–507*).—The previous literature on this subject is briefly discussed. The authors conducted experiments with the bacillus of Preisz for the purpose of determining whether this organism was the specific cause of pyelonephritis. During the experiments it was found that the

disease was not produced by this organism—merely a local inflammation resulted, without the characteristic symptoms of pyelonephritis.

The therapeutic use of tannoform in intestinal diseases of calves, SCHÜNHOFF (*Berlin. Thierärztl. Wchnschr., 1902, No. 45, pp. 678, 679*).—In the author's practice tannoform combined with calomel has given excellent results in the treatment of diarrhea and other intestinal disturbances in calves. The mixture is prepared so as to contain 1 part of calomel to 100 parts of tannoform.

The treatment of green diarrhea of calves, G. CARLE (*Jour. Agr. Prat., n. ser., 5 (1903), No. 4, p. 109*).—Considerable success has been had in treating certain intestinal disturbances of children with gelatin. The effectiveness of this treatment is supposed to depend on the power of gelatin to protect the walls of the stomach and intestines against the harmful effects of certain bacteria and toxic products. In the treatment of diarrhea in calves promising results have been obtained by this method. Further experiments will be made.

Coccidiosis of sheep, and the parasitic organism, G. MOUSSU and G. MAROTEL (*Arch. Parasit., 6 (1902), No. 1, pp. 82–98, figs. 10*).—The authors describe in considerable detail the morphological characters of the protozoan organism which causes coccidiosis. Notes are also given on the pathological anatomy of this disease. The organism in question is often found in sheep also infested with palisade worms, and the lesions caused by the protozoan parasite are frequently attributed to the palisade worms. The organism of coccidiosis is believed by the authors to differ from *Coccidium zürni* and other related species of this genus. It is described as new, under the name *Coccidium faurei*.

Some pig diseases (*Jour. Jamaica Agr. Soc., 7 (1903), No. 1, pp. 22, 23*).—Brief notes on hog cholera and swine plague.

Swine erysipelas, M. TEMPEL (*Deut. Thierärztl. Wchnschr., 10 (1902), No. 52, p. 493*).—The author reports finding endocarditis as the immediate cause of death in hogs which had completely recovered from urticaria. It is believed, therefore, that urticaria belongs etiologically with swine erysipelas and that valvular endocarditis may appear in young hogs within 8 weeks after recovery from a case of swine erysipelas.

Recent results in combating swine plague, SCHREIBER (*Berlin. Thierärztl. Wchnschr., 1902, No. 48, pp. 749–755*).—The history of the development of methods for obtaining polyvalent sera in the treatment of infectious swine diseases is presented in considerable detail. The article is largely of a controversial nature. It is argued that any serum, in order to possess polyvalent action, must be calculated to operate not only against bacteria and other toxins, but also against local toxins formed in the animal tissues during the progress of the disease.

A pyogenic micro-organism in the hog, W. GRIPS (*Inaug. Diss., Univ. Giessen [1902], pp. 33*).—The author found fibrous deposits and abscesses in the peritoneum and serous lining of the thorax of hogs. In these abscesses a bacillus was found which is described as new, under the name *B. pyogenes suis*. The suppuration processes show a strong tendency to encapsulation. The pus is of a thick consistency without disagreeable odor and of a greenish color, and the bacillus which is considered as a cause of the suppuration is not always found alone, but is frequently associated with other bacteria. The organism is pathogenic for rabbits and mice when injected in comparatively large quantities. It gains entrance to hogs through various skin wounds, through the air passages and mucous membranes of the mouth and pharynx.

Septicemic brown neck of hogs, GRAFFUNDER and SCHREIBER (*Deut. Thierärztl. Wchnschr., 10 (1902) No. 50, pp. 471–473*).—The author describes an outbreak of a peculiar septicemic disease among pigs 6 to 8 months old. These pigs were allowed to run in woodland pasture. The symptoms were disturbances of the general condition, dis-

inclination to move, reddening and swelling of the mucous membranes of the head, salivation, excessive swelling of the neck, especially in the region of the larynx, and coughing. From post-mortem examination it was found that extensive series of infiltration had taken place in the musculature of the head and neck and as far back as the chest. The submaxillary and retropharyngeal lymphatic glands were enormously swollen. Ovoid bacteria which stained in a bipolar manner were found in streak cultures made from material obtained from these cases. These organisms were first suspected of being anthrax bacilli. It was later found, however, that the hogs had eaten the carcass of a steer which probably died of rinderpest. The author believes that the bacilli found in the hogs and which closely resemble the necrosis bacillus, probably made their way into the hogs in connection with the meat of the diseased steer. Brief notes are given on other cases of septicemic infection in hogs and other animals for the purpose of comparing known examples with the cases which came under the authors' attention.

On the behavior of the lymphatic apparatus in intestinal ulcerations in hogs, SEILER (*Deut. Thierärztl. Wchnschr., 10 (1902), Nos. 36, pp. 345–347; 37, pp. 353–355; 38, pp. 361–364, figs. 2*).—The literature of this subject is critically discussed. Special attention is given to an account of the behavior of the lymphatic system in cases of intestinal ulceration in hogs due to the presence of *Œsophagostomum venulosum* and as a result of swine plague and hog cholera. A considerable part of the author's work consisted in a study of a series of sections made through such ulcers and preserved and stained by various methods. A hyperplasia and excessive accumulation of white blood corpuscles in the neighborhood of these ulcers were observed in most cases of infestation by the palisade worms. The various stages in the formation of intestinal ulcers in cases of swine plague and hog cholera are described in detail.

Glanders, R. HÖTTINGER (*Bol. Agr. São Paulo, 3. ser., 1902, No. 7, pp. 435–437*).—Brief notes on the post-mortem findings in 4 cases of glanders, together with a discussion of the diagnosis and etiology of this disease and notes on the use of mallein.

Tsetse fly disease in Togo, West Africa, H. ZIEMANN (*Berlin. Klin. Wchnschr., 39 (1902), No. 40, pp. 930–936*).—The author presents a general account of the etiology of this disease, together with notes on the life history of the blood parasite.

The so-called Borna horse disease, ENDERS (*Berlin. Thierärztl. Wchnschr., 1902, No. 44, pp. 653–658*).—Notes are given on the etiology, pathogenesis, symptoms, complications, sequelæ, and treatment of this disease.

Scratches or grease heel in horses, N. S. MAYO (*Industrialist, 29 (1902), No. 19, p. 301*).—Notes are given on the symptoms of this disease and on the frequency of its occurrence in horses. The treatment recommended consists in cleanly surroundings, poulticing affected parts, and the use of antiseptic ointments.

Mammary botryomycosis in the horse, P. UNTERHÖSSEL (*Berlin. Thierärztl. Wchnschr., 1902, No. 32, pp. 476, 477, figs. 2*).—This disease occurs chiefly in horses, while cattle and hogs appear to be only slightly susceptible to it. Brief notes are given on a number of cases which are reported in the literature on this subject, and a detailed history is presented of one case which occurred in the udder, with fatal results.

The origin of aneurysma verminosum equi, A. STICKER (*Deut. Thierärztl. Wchnschr., 10 (1902), No. 28, pp. 274–276*).—A number of cases of aneurism in horses caused by the presence of *Sclerostomum bidentatum* were examined by the author with special reference to determining the pathological histology of this disease. It was found that the middle coat of the wall of the blood vessels was chiefly affected, and not the inner coat. A number of cases of this disease were investigated and detailed notes are given on the histogenesis of the aneurisms.

A study of the morphology of the blood of the horse, S. H. BURNETT (*Amer. Vet. Rev., 26 (1902), No. 4, pp. 311–325, figs. 10*).—The objects of the investigation

reported in this thesis were to determine the structure and condition of the blood of healthy horses and of horses which are suffering from various diseases. Notes were given on the technique employed in this investigation and on the size, appearance, and relative proportion of red corpuscles and 5 varieties of leucocytes which were observed, viz, lymphocytes, large mononuclear leucocytes, polynuclear leucocytes, eosinophilous and mast cells. The variations in the number of these elements in different diseases are presented in tabular form.

Observations on rabies in the district of Habelschwerdt, C. WITTLINGER (*Berlin. Thierärztl. Wchnschr., 1902, No. 30, pp. 449–453*).—A brief historical account is given of rabies in this district and notes are presented on the cases which have been observed in man and animals. A copy is given of the laws which are in force in this district for preventing the spread of the disease.

Antirabies vaccinations in St. Petersburg, V. KRAIOUCHKINE (*Arch. Sci. Biol. [St. Petersburg], 9 (1902), No. 3, pp. 337–342*).—Statistical notes are given on the number of persons bitten by presumably rabid dogs and other animals, and on the results of antirabies vaccinations. Notes are also presented on the number of animals suspected of being affected with rabies. The mortality among patients treated by the Pasteur method was 0.18 per cent.

Vaccination of dogs for distemper, H. MEYER (*Berlin. Thierärztl. Wchnschr., 1902, No. 45, p. 678*).—According to the author the antidistemper serum manufactured by the Jenner Institute in London has given excellent results in his practice, in preventing the development of distemper in young dogs.

Alopecia areata pigmentosa in dogs, V. S. TROFIMOV (*Arch. Vet. Nauk, St. Petersburg, 32 (1902), No. 11, pp. 921–930, pls. 5*).—Detailed notes are given on the etiology and pathological histology of this disease.

The action of ticks upon animal blood, P. GRÜTZNER (*Deut. Med. Wchnschr., 28 (1902), No. 31, pp. 555, 556*).—A study was made of the changes undergone by the blood of dogs in the body of *Ixodes ricinus*. It was found that the oxygen is removed from the arterial blood and that the red blood corpuscles are completely dissolved, thus setting free the coloring matter.

The tapeworms of ruminants, N. KHOLODKOVSKI (*Arch. Parasit., 6 (1902), No. 1, pp. 145–148, pl. 1, fig. 1*).—Brief anatomical and descriptive notes on certain species of tapeworms which infest ruminants.

Observations on fowl plague, KÜNNEMANN (*Deut. Thierärztl. Wchnschr., 10 (1902), Nos. 43, pp. 413–415; 44, pp. 421–424*).—Opportunity was had by the author to study a number of outbreaks of fowl plague. It appears that the disease has now been observed in a number of different localities in Germany, and in some of these outbreaks there is no evidence of importation of the fowls from Italy or other localities where the disease was previously known to exist. The symptoms are not very uniform, but the course of the disease is almost always exceedingly short. Death occurred in the majority of cases after 3 or 4 days. Frequently the comb and wattles exhibited a bluish red color after death. Usually an exudate was observed in the body cavity, and the vital organs in almost all cases were affected with more or less serious alterations. The author found it impossible to isolate any microorganism which could be considered as the pathogenic cause of the disease. This plague is believed to be identical with the disease previously described as cyanolophia. Pigeons were found to be immune. Transmission experiments with ducks also gave negative results. White mice, guinea pigs, and rabbits proved refractory. Chickens, however, are susceptible to inoculation and to infection by way of the alimentary tract. The virus is destroyed by decomposition within a short time, provided the carcasses of affected fowls are opened. In intact carcasses, however, the virus remains virulent for at least 28 days. The virus is only moderately resistant to heat and is readily destroyed by carbolic acid or corrosive sublimate. The author successfully disinfected poultry houses by the use of milk of lime.

Serum therapy in fowl cholera, WILLERDING (*Deut. Thierärztl. Wchnschr., 10 (1902), No. 50, pp. 473, 474*).—The author conducted a number of experiments for the purpose of testing the value of the Landsberg Septicidin and the fowl cholera serum of Jess and Piorkowski. Neither of these sera was found to have any noticeable effect in protecting healthy fowls against infection from fowl cholera or increasing the resistance of birds which were already infected.

The chicken mite, G. W. HERRICK (*Mississippi Sta. Bul. 78, pp. 13, figs. 4*).—The most favorable conditions for the rapid multiplication of the chicken mite are filth and insufficient illumination of the chicken houses. The author made a number of experiments in the construction of nests and roosts so that these structures could be readily cleaned and illuminated. In combating the chicken mite with direct remedies the author tested the value of a method which consisted in cleaning the houses once every 2 weeks and dusting them with a mixture containing 3 parts of air-slaked lime and 1 part sulphur. This method was quite effective, but the author believes that the insecticide should be applied at least once per week. Good results were obtained from the use of crude petroleum and kerosene. These insecticides were sprayed or rubbed upon the walls of the nests and other structures in the chicken houses. Kerosene was found to be as effective as crude petroleum, but its effects did not persist so long, since it evaporated more rapidly. During the season of the year when dust is not accessible to the hens the author recommends that boxes containing road dust should be provided for them. Badly infested old chicken houses of slight value may be burned and new ones constructed, or they may be disinfected by the remedies already mentioned and the use of boiling water. Poultry houses should not be in connection with barns or stables, and sitting hens should be isolated from the rest of the hens, so as to prevent their infestation by mites.

The incineration in the open field of carcasses affected with anthrax, VOLMER (*Berlin. Thierärztl. Wchnschr., 1902, No. 41, pp. 617, 618*).—Various material has been used in producing heat for the incineration of anthrax carcasses in the open field, and notes are given on the comparative cost of the process according to these different methods. The author recommends that the incineration be conducted under the direction of officials, so that complete destruction of the carcasses may be secured.

Innocuous disposal of animal carcasses by means of burning, LOTHES and PROFÉ (*Berlin. Thierärztl. Wchnschr., 1902, No. 37, pp. 557–560*).—A detailed report is given of a number of experiments which were conducted for the purpose of determining the relative effectiveness and cost of various incineration methods for destroying animal carcasses. It is recommended that unusual care be exercised to secure the complete destruction of all carcasses in cases of serious infectious diseases.

American meat inspection, A. ZSCHOCKE (*Deut. Thierärztl. Wchnschr., 10 (1902), Nos. 31, pp. 301–304; 32, pp. 309–312*).—Attention is called briefly to meat inspection in this country as conducted under the auspices of city, State, and national authority. Detailed notes are given on the method of inspecting meat under the orders of the Bureau of Animal Industry, and on veterinary police work, transportation of animals, and other functions of this Bureau.

TECHNOLOGY.

A study of cider making in France, Germany, and England, with comments and comparisons on American work, W. B. ALWOOD (*U. S. Dept. Agr., Bureau of Chemistry Bul. 71, pp. 114, pls. 7, figs. 26*).—The author visited some of the more important cider-making districts in France, Germany, and England, and describes the methods observed in those countries in the manufacture of cider. Factories are described in some instances as well as the machinery used, and the methods of harvesting the fruit, handling the must, fermenting, clarifying, etc.

Analyses are given of a large number of European and American ciders and a short bibliography of French, German and English works on cider making is appended.

The effects of fermentation upon the composition of cider and vinegar, C. A. BROWNE, JR. (*Jour. Amer. Chem. Soc., 25 (1903), No. 1, pp. 16–33, fig. 1, dgms. 2*).—A 25-gal. cask was filled with the fresh cider of an unknown variety of apples. The cask was stored in a dry, cool cellar from November 15, 1898, to October 13, 1902, and analyzed from time to time to determine the chemical changes which took place. Fermentation was the greatest from the fourth to the seventh week after storing. During fermentation the sucrose and dextrose were completely removed, but a small percentage of levulose remained unaffected owing to the development of acetic acid, which arrests alcoholic fermentation. In the experiment 100 parts of sugar gave an actual yield of 45.4 parts of alcohol, or about 88.8 per cent of the theoretical yield. The loss in weight of the cider during the 169 days of the alcoholic fermentation was about 2.4 per cent. It is pointed out that in cider making a very serious loss in alcohol may result from the development of acetic acid. In the experiment recorded there was a loss of about 0.7 per cent of alcohol formed from sugar by the development of 0.23 per cent of acetic acid. The loss in cider making from this source, it is stated, can be prevented largely by racking off the cider after the main fermentation into other casks and bunging tightly. Since the presence of acetic acid is detrimental to the development of alcohol, the failures reported by farmers in getting the vinegar to "make" when they add fresh cider to old vinegar is accounted for.

In the acetic fermentation 100 parts of alcohol gave an actual yield of 116.3 parts of acetic acid, or 89.2 per cent of the theoretical yield.

The bung of the vinegar cask was left open for 18 months from July, 1900. During this period the weight of the vinegar in the cask decreased 30 per cent. The acetic acid content decreased over 2.5 per cent, due mostly to destructive fermentation caused by *Bacterium xylinum*, or an allied form which had the property of forming cellulose. During the deterioration of the vinegar there occurred a relatively high increase in the percentage of reducing sugar. Upon examination this was found to be caused by the presence of 2 well-defined osazones, one of which after recrystallization melted at 142 to 143°, and therefore corresponded to the phenolformosazone of Fischer.

"As a remedy against deterioration, vinegars intended for storage should be racked off into clean casks, the latter filled full and tightly bunged. Since none of the acetic organisms can thrive without air, their further development is thus prevented, and the loss from destructive fermentation reduced to a minimum."

Analysis of the dried settlings in the vinegar cask gave the following results: Moisture, 4.91 per cent; fat, 1.69 per cent; protein, 20.13 per cent; ash, 2.65 per cent; crude fiber, 5.69 per cent; nitrogen-free extract, 64.93 per cent. Analyses were also made of the ash of apples, cider, and vinegar settlings. These are shown in the following table:

Ash analyses of apples, cider, and vinegar settlings.

	Ash of apples.	Ash of cider.	Ash of settlings.
	Per cent.	*Per cent.*	*Per cent.*
Potassium oxid	58.31	60.60	19.94
Ferric oxid and aluminum oxid	12.26	6.00	19.97
Calcium oxid	Undetermined.	1.15	4.17
Magnesium oxid	Undetermined.	Undetermined.	2.22
Phosphoric acid	12.51	7.12	29.64
Sulphuric acid	6.87	4.15	.14
Silicic acid	1.65	1.90	24.23
Undetermined carbonic acid, etc	8.40	19.08	.....

Notes on vinegar making, E. F. PERNOT (*Oregon Sta. Bul. 73, pp. 8*).—Vinegar was made at the station from undersized and otherwise unsalable prunes. After running the washed and weighed prunes through a homemade machine with spiked rollers which lacerated and tore them, the mass was inoculated with a pure culture of yeast (*Saccharomyces cerevisia*). This caused a strong and rapid fermentation, which broke down the cell walls of the prunes, thus liberating the clear juice, which flowed into a receptacle below the vat. This method of securing the clear liquid was inexpensive and very satisfactory. In all 10,482 lbs. of Italian prunes were used, from which 630 gal. of juice was obtained, or a yield of a little more than 3 gal. of juice per bushel of fruit. The juice was fermented in open barrels. Fermentation was completed in 10 days, when the juice was found to contain 10 per cent alcohol. It was then inoculated with a pure culture of vinegar ferment (*Bacilli pasteuranum*) by floating it on the surface of the liquid by means of pieces of cork weighted so as to bring the culture in contact with the liquid.

The vinegar thus produced was of excellent quality, with a fruity flavor and good body, analyzing 6.89 per cent total solids. The only objection to it was its color, which was that of very dark wine. It was, however, but little darker than imported malt vinegars, which find ready sale in Oregon markets. Experiments are now in progress to see if some method of clarification can be found which will improve the color. The machine used for lacerating the prunes and the vat for fermenting and collecting the juice are described in detail, and a brief discussion given of the principles of vinegar making and of the best ways of making vinegar for the home.

The small vinegar fly (*Drasophila ampelophila*) was allowed to walk over sterile cultural media under control conditions. Wherever its feet touched the media colonies of acetic-acid germs developed. The digestive tract of this fly was also found to contain large numbers of acetic-acid germs which were capable of growth in sterilized cider. It is therefore believed that this fly is of service in inoculating fruit juices with the necessary germs for producing vinegar. They will also, however, carry spores of molds and other organisms which give a bad flavor to vinegar. Therefore, the use of pure cultures of vinegar ferments is advised. The author states that the station can furnish these, upon application, to residents of the State.

Pear vinegar containing 8.89 per cent acetic acid has been made at the station, and apple vinegar which analyzed 6 per cent acetic acid within 4 months from the time the apples were pressed.

The essentials in making good vinegar are thus stated: "The barrels must be free from must and mold, the depth of the liquid should not exceed the surface measure, free air must be continually admitted, an even, warm temperature should be maintained, and, last but not least, the fruit that is used should be free from decay and mold."

Experiments in wine making, H. SCHELLENBERG (*Jahresber. Vers. Stat. u. Schule, Wädensweil, 1899–1902, pp. 44–46*).—Sal ammoniac added to a cask of pear cider at the rate of 20 gm. per hectoliter conduced to a more rapid and complete fermentation of the must than when it was omitted. Pears just beginning to ripen were used. No influence of the sal ammoniac on the taste of the wine could be detected. Apple and pear wines filtered through a cellulose filter kept fresher during storage and were more highly prized than wine clarified by the addition of 60 gm. of gelatin per hectoliter. A variety of sweet apple was gathered for cider when just beginning to ripen. The flesh was still firm and somewhat acid. A given quantity of these apples yielded more juice and produced a better quality of cider than apples of the same kind gathered 3 weeks later when they had become more mellow. Wine that had become flat in drawing off and clarifying was again made drinkable by the addition of carbonic acid.

Composition and determination of differently prepared wines, W. KELHOFER (*Jahresber. Vers. Stat. u. Schule, Wädensweil, 1899–1902, pp. 70–*).—Analyses

are given of wines in which juice only was fermented, pulp and juice fermented together, and juice to which sugar and water had been added.

American wines at the Paris Exposition of 1900, their composition and character, H. W. Wiley; **with a monograph on the manufacture of wines in California,** H. Lachman (*U. S. Dept. Agr., Bureau of Chemistry Bul. 72, p. 40, pls. 2*).—An account is given of the judging of American wines at the Paris Exposition, including analyses of those which received awards. The wines examined included 9 samples of sparkling wines, 2 of brandies, 15 of dry white wines, 22 of dry red wines, 9 of sweet white wines, and 9 of sweet red wines. The analyses are much more complete than those recorded of American wines in the earlier bulletin from the Bureau (E. S. R., 12, p. 994), including data on the glycerol content, specific gravity, polarization, content of alcohol, tartaric acid, sulphurous acid, phosphoric acid, potassium sulphate, extract, ash, reducing sugars, total and volatile acids, and nitrogen. The analytical data obtained are compared with the analyses of standard European wines.

In the second part of the bulletin a discussion is given of the methods observed in California in the production of different California wines. A list is given of the varieties of wine grapes grown and the kinds of wine made from each. In addition, such other matters are discussed as harvesting, fermentation, clarification, tasting, bottling, marketing, and type of wines.

Agricultural fermentation industries, E. Boullanger (*Industries agricoles de fermentation. Paris: J. B. Baillière & Son, 1903, pp. XII + 466, figs. 66*).—This is a volume of the agricultural encyclopedia published under the direction of G. Wery. It treats of cider making; brewing; preparation of hydromel, brandies, and rum; and distilling.

Musts and wines in distilling, L. Lévy (*Les mouts et les vins en distillerie. Paris: C. Naud, 1903, pp. IV + 651, figs. 160*).—This book deals with the history of distilling, statistics of the industry, theoretical considerations, the chemistry of the compounds involved in the process, a study of the natural products from which alcohol is prepared, and the technology of the preparation of wines and musts.

The preparation of cherry wine with and without the addition of currants, W. Kelhofer (*Jahresber. Vers. Stat. u. Schule, Wädensweil, 1899–1902, pp. 95–99*).—An account of the making of wine from cherries alone, cherries to which citric acid and sugar had been added, and from cherries and currants to which water and sugar had been added. In some cases the juice was fermented alone and in others with the flesh, skins, etc., of the fruit. In order to prevent the development of acetic acid in the cherry-currant wine it is advised that fermentation take place in a cool dark cellar at a low temperature.

Annual report on investigations and progress in the manufacture of sugar, J. Bock (*Jahresber. Zuckerfab., 41 (1901), pp. XII + 374, figs. 48*).—A review for the year 1901 of investigations on the culture and handling of sugar beets and the manufacture of beet sugar.

Cassava as a competitor of maize in the production of starch and allied products, G. Archbold (*Jour. Soc. Chem. Ind., 28 (1903), No. 2, pp. 63–66, figs. 3*).—A discussion of the yield and characteristics of starch from cassava based mainly upon the work of the Bureau of Chemistry of this Department and an account of the method of manufacture followed in Florida. Cassava yields about 25 per cent of starch which "would easily take the place of corn starch or starch made from other cereals." The general conclusion reached is "that in cassava, when properly cultivated, we have a formidable competitor of maize, owing to its higher yield of starch and glucose per acre, and as not only is its starch and sugar, but also a considerable portion of the fiber, obtained as glucose, thereby producing a much sweeter and finer-flavored product, and better adapted for confectionery, etc., fully 30 per cent of the fresh root being obtained as glucose."

A new method of extracting olive oil, A. FUNARO (*Staz. Sper. Agr. Ital., 35 (1902), No. 11-12, pp. 916–921*).—A description is given of a method of oil extraction that is said to yield several per cent more oil than that secured by the ordinary process.

Modern American tanning (*Chicago: Jacobsen Pub. Co., 1902, pp. 202, pls. 14, figs. 2*).—This is a compilation of articles on the manufacture of leather which appeared originally in *Hide and Leather*.

AGRICULTURAL ENGINEERING.

Report of irrigation investigations, Humboldt River Valley, Nevada. J. D. STANNARD (*Nevada Sta. Bul. 54, pp. 91, pls. 34*).—A report is given of observations on the extent and character of irrigation practiced in the valley, irrigation works, crops grown, claims to water and their adjudication, the unit of measurement, and the distribution and more economical use of water are discussed, with suggestions as to the improvement of the system and methods now in vogue.

Eleventh Biennial Report of the State Engineer of Colorado, 1901–2, A. J. MCCUNE (*Denver, 1902, pp. 334, ills.*).—This volume is devoted largely to reports from various superintendents of irrigation and water commissioners, crop statistics, and other routine matters, but contains special reports on Drainage and Seepage Measurements, by C. G. Elliott; and The Measurement of Water, by A. L. Fellows (E. S. R., 13, p. 1103).

Irrigation works of India, R. F. PATTERSON (*U. S. Consular Rpts., 71 (1903), No. 270, pp. 356–359*).—A brief account of these works, including statistics of capital invested, revenues, and area irrigated. The capital outlay to the end of 1900–1901 is given as $128,181,526, the net revenues $8,740,016, the area irrigated 13,547,986 acres.

Irrigation in Spain and North Africa, J. BRUNHES (*Thesis, Univ. Paris, 1902, pp. XVII + 518, figs. 63, maps 7*).—This treatise deals with geographical conditions, methods, and organization and is styled a study in human geography. The regions chosen for study are the Spanish Peninsula, Algiers and Tunis, and Egypt. There is added a bibliography of a large number of publications on irrigation used or cited in the preparation of this treatise.

The Nile dams and reservoir, SIR B. BAKER (*Pop. Sci. Mo., 62 (1903), No. 6, pp. 550–561, figs. 6*).—This is an address given before the Royal Institution of Great Britain.

A self-adjusting weir (*Irrig. Age, 18 (1903), No. 5, pp. 138, 139, figs. 3*).—A brief statement of the claims made for such a device, invented by C. C. Carlisle, assistant State engineer of Wyoming. The principal feature of this weir is a short movable conduit, connected with floats, which moves up and down over the end of a fixed conduit (which is a little smaller in diameter) as the level of the water in the canal rises and falls. The joint between the movable and fixed conduits is sealed with mercury.

On the conversion of a tidal marsh into a meadow, G. BECKER (*Deut. Landw. Presse, 30 (1903), No. 15, pp. 118, 119*).

Recent progress in the field of agricultural machinery (*Fühling's Landw. Ztg., 51 (1902), Nos. 11, pp. 410, 411; 12, pp. 450, 451; 13, pp. 488–492; 14, pp. 521–524, figs. 2; 15, pp. 556–559, figs. 2; 16, pp. 601–603, figs. 2; 17, pp. 638–641, figs. 3; 18, pp. 681–683, fig. 1; 19, pp. 725–727, fig. 1; 20, pp. 765–767, figs. 2; 21, pp. 797, 798, fig. 1; 22, pp. 832–835; 23, pp. 871–874, figs. 2; 24, pp. 910–914, figs. 6*).—This is a series of articles on this subject by different authors, including H. Puchner, A. Nachtweh and W. Heerberger. The subjects discussed in these articles include root and straw cutters, harrows and soil levelers, hay-tedder and press, plows, scythe-sharpening machine, hitching device for horse powers, root digger, mowers and reapers, stationary and portable steam engines.

Methods and machines for cultivating the soil, M. RINGELMANN (*Travaux et machines pour la mise en culture des terres. Paris, 1902, pp. 188, figs. 267*).

Test of binders, 1902, A. NACHTWEH (*Arb. Deut. Landw. Gesell., 1903, No. 79, pp. 68, figs. 64*).—Six grain binders of American make are described and tests of the amount and character of work performed by them and of the draft are reported.

Practicability and adaptability of gasoline engines for agricultural conditions, G. TIMBERG (*K. Landt. Akad. Handl. och Tidskr., 43 (1903), No. 1, pp. 26–35, figs. 3, dgm. 1*).

Note on simple machines for extracting plantain fiber, R. L. PROUDLOCK (*Dept. Land Records and Agr., Madras, Vol. II, Bul. 47, pp. 261–268, figs. 2*).—Attention is called to the possibilities of the common plantain as a fiber plant, and descriptions of 2 types of primitive machines used in the Philippine Islands for extracting the fiber are given.

Measures for the prevention of accidents with agricultural machinery, W. HOFFSTEDT (*K. Landt. Akad. Handl. och Tidskr., 43 (1903), No. 1, pp. 14–25, figs. 9*).

Proceedings of the Jefferson Memorial and Interstate Good Roads Convention, held at Charlottesville, Va., April 2, 3, and 4, 1902 (*U. S. Dept. Agr., Office of Public Road Inquiries Bul. 25, pp. 60, pls. 5, figs. 3*).

Road construction, L. H. ADAMS (*Wisconsin Sta. Rpt. 1902, pp. 280, 281, pl. 1*).—A brief account is given of the construction of a macadam road on the University of Wisconsin farm.

Silos and silage, C. S. PLUMB (*U. S. Dept. Agr., Farmers' Bul. 32, rev. ed., pp. 30, figs. 6*).—A thorough revision of this bulletin, which has been in large part rewritten.

MISCELLANEOUS.

Fourteenth Annual Report of Connecticut Storrs Station, 1901 (*Connecticut Storrs Sta. Rpt. 1901, pp. 253*).—This includes the organization list of the station, a financial statement for the fiscal year ended June 30, 1901, a report of the director presenting a general review of station work during the year, and miscellaneous articles noted elsewhere.

Fifteenth Annual Report of Georgia Station, 1902 (*Georgia Sta. Rpt. 1902, pp. 251–260*).—This includes the organization list of the station, reports of the commissioner of agriculture and the director on the work of the station during the year, and a financial statement for the fiscal year ended June 30, 1902.

Twentieth Annual Report of New York State Station, 1901 (*New York State Sta. Rpt. 1901, pp. 434*).—This includes the organization list of the station; a financial statement for the year ended September 30, 1901; a list of periodicals received by the station; a meteorological record noted elsewhere; and reprints of circulars of the station on ginseng culture and "red albumen" and of Bulletins 197–211 of the station on the following subjects: The food source of milk fat, with studies on the nutrition of milch cows (E. S. R., 13, p. 781); inspection of feeding stuffs (E. S. R., 13, p. 774); an epidemic of currant anthracnose (E. S. R., 13, p. 758); notes from the botanical department (E. S. R., 13, p. 759); report of analyses of commercial fertilizers for the spring and fall of 1901 (E. S. R., 13, p. 935); San José scale investigations, III (E. S. R., 13, p. 968); a study of enzyms in cheese (E. S. R., 13, p. 1087); report of analyses of Paris green and other insecticides in 1901 (E. S. R., 13, p. 1068); influence of manure upon sugar beets (E. S. R., 13, p. 1042); commercial fertilizers for onions (E. S. R., 13, p. 1047); conditions affecting weight lost by cheese in curing (E. S. R., 13, p. 1088); stable manure and nitrogenous chemical fertilizers for forcing lettuce (E. S. R., 13, p. 1046); treatment for San José scale in orchards—I, orchard fumigation (E. S. R., 13, p. 1064); the immediate effect on milk production of changes in the ration (E. S. R., 14, p. 77); and director's report for 1901 (E. S. R., 14, p. 95).

Twenty-fourth Annual Report of North Carolina Station, 1901 (*North Carolina Sta. Rpt. 1901, pp. XX 138*).—This includes the organization list of the station, general reports on the different lines of station work, a financial statement for the fiscal year ended June 30, 1901, and reprints of Bulletins 175–180 of the station, on the following subjects: Some new species of the genus Cratægus and notes on some dichotomous Panicums (E. S. R., 12, p. 827), the relative values of some nitrogenous fertilizers (E. S. R., 13, p. 122), edible mushrooms of North Carolina (E. S. R., 13, p. 225), the nature of pentosoids and their determination (E. S. R., 13, p. 321), the composition of cotton-seed meal (E. S. R., 13, p. 479), and the sugar beet in North Carolina (E. S. R., 13, p. 446).

Fifteenth Annual Report of Tennessee Station, 1902 (*Tennessee Sta. Rpt. 1902, pp. 16, figs. 2*).—This includes the organization list of the station, departmental reports upon the work of the station during the year, a list of available station publications, and a financial statement for the fiscal year ended June 30, 1902.

Nineteenth Annual Report of Wisconsin Station, 1902 (*Wisconsin Sta. Rpt. 1902, pp. 302*).—This includes the organization list of the station; a report of the director containing a brief description of the new agricultural building, notes on changes in the station staff, brief statements concerning the control of fertilizers and feeding stuffs and other lines of station work, and a list of available station publications; a brief biographical sketch of the late Prof. E. S. Goff; numerous articles abstracted elsewhere; lists of exchanges and acknowledgments; and a financial statement for the fiscal year ended June 30, 1902.

Proceedings of the sixteenth annual convention of the Association of American Agricultural Colleges and Experiment Stations, held at Atlanta, Ga., October 7-9, 1902, edited by A. C. True, W. H. Beal, and H. C. White (*U. S. Dept. Agr., Office of Experiment Stations Bul. 123, pp. 144, pls. 2*).—For a summary of the proceedings see E. S. R., 14, p. 313.

On the establishment of agricultural experiment stations in Mexico, S. Bonansea (*Mem. y Rev. Soc. Cient. "Antonio Alzate," 17 (1902), No. 6, pp. 235–249*).—An argument in favor of the establishment of such stations and a statement of lines of work they might usefully undertake.

The promotion of agricultural science, W. H. Jordan (*Proc. Soc. Prom. Agr. Sci. 1902, pp. 22–33*).—This is the presidential address delivered at the twenty-third annual meeting of the Society for the Promotion of Agricultural Science, held at Pittsburg, 1902.

General agriculture, P. Diffloth (*Agriculture générale. Paris: J. B. Baillière & Son, 1903, pp. XII+416, figs. 102*).—This is one volume of the agricultural encyclopedia published under the direction of G. Wery. The subjects discussed are agrology, including study and analysis of the soil and the relation of the soil to plants; cultivation of the soil, including reclamation, preparation, improvement, distribution of fertilizers and soil amendments, seeding, maintenance, destruction of weeds, harvesting, and preservation of crops; and rotation.

Practical farming and gardening (*Chicago and New York: Rand, McNally & Co., 1902, pp. 500, figs. 223, chart 1*).—This book consists of a series of chapters by different authors, to which are appended extensive lists of publications bearing on the special subjects discussed. In the several articles an attempt has been made to present "a brief but sufficiently comprehensive introduction to modern agricultural practice . . . to give so clear an insight into the essentials of farming under modern conditions as will simplify and illuminate all future reading . . . and to tell the man who wants to read on any given farm topic where he may find the book he wants." The articles included are: Modern Ideas in Soil Treatment and Tillage, by J. J. Edgerton; Field Crops—Their Adaptations and Economic Relations, with Specific Cultural Directions, by J. J. Edgerton; Vegetable Garden and Trucking Crops, by A. T. Erwin; Fruit Culture and Forestry, by L. R. Taft; Important Injurious In-

sects and Diseases Affecting Field and Garden Crops, Fruits, and Shade Trees, by E. S. G. Titus; Selecting and Feeding Farm Animals for Profit, by H. W. Mumford; Beef Making, by L. H. Kerrick; Feeding Native Cattle for Beef, by J. P. Stevenson; Feeding Range Cattle for Beef, by D. Rankin; Diseases of Farm Animals, by R. A. Craig; The Silo in Modern Agriculture, by F. W. Woll; Making Poultry Pay, by P. H. Jacobs; Handy Rules and Useful Information; and Wholesome Cooking Without Waste.

The book of the farmer, A. Bruttini (*Il libro dell'agricoltore. Milan: Ulrico Hoepli, 1902, pp. XIX+446, figs. 303*).—A popular treatise discussing the soil and plant life; giving directions for the culture of the vine, and all important field, orchard, and garden crops, and describing the raising and feeding of live stock.

The Lupitz estate and its production, C. Vibrans (*Die Wirtschaft Lupitz und ihre Erträge. Berlin: Deut. Landw. Gesell., 1902, pp. 33*).—The history of the estate is given, together with annual financial statements showing the profits due to the Lupitz system of improving sandy soils.

Recent foreign explorations as bearing on the agricultural development of the Southern States, S. A. Knapp (*U. S. Dept. Agr., Bureau of Plant Industry Bul. 35, pp. 44, pls. 6, figs. 2*).—This bulletin deals with the method and cost of rice production and the culture of certain other crops in Japan, Ceylon, India, China, and the Philippine Islands. The agricultural conditions and practices in each of the different countries are discussed.

Cooperations among farmers for certain economic ends, M. Hansson, E. Insulander, and G. Leufven (*Meddel. K. Jordbruksdept. [Sweden], 1902, No. 6, pp. 158, maps 3*).—The report contains an historical description and discussions of cooperative enterprises among farmers in the line of creameries, dairy control associations, bull associations, purchasing associations, and egg-shipping associations. Samples of articles of agreement are given in the case of each kind of association.—F. W. Woll.

Report of the Bureau of Farmers' Institutes, 1900 (*Rpt. New York State Dept. Agr., 8 (1900), IV, pp. 489*).—This contains a list of the farmers' institutes held in 1900, numerous questions asked and answered, and 22 papers presented at the meetings. Among the subjects considered were the following: The Composition and Use of Fertilizers, by L. L. Van Slyke; Butter Making, by G. A. Smith; Barn Construction and Sanitation, by H. E. Cook; Alfalfa in New York, by F. E. Dawley; Temperature and Moisture in Relation to Cheese Ripening, by I. L. Van Slyke; The Evolution of Dairying, by J. Van Wagenen, jr.; The Next Step in the Education of the Farmer, by W. H. Jordan; The Silo and the Material to Fill It, by I. P. Roberts; and The Progress of Dairy Farming in Canada, by J. Robertson.

The officials and laborers of Upper Egypt, H. C. Hanson (*Deut. Landw. Presse, 30 (1903), Nos. 13, pp. 97–100, fig. 6; 15, pp. 117–119, figs. 3*).

Commercial relations of the United States with foreign countries during the year 1902 (*Washington: Department of State, Bureau of Foreign Commerce, 1903, vols. 1, pp. 1225; 2, pp. 989*).

Agricultural and commercial statistics for 1901, B. E. McLin (*Rpt. Comr. Agr. Florida, 1901 and 1902, pp. 133–217*).—Statistics on the production of field crops, vegetables, fruits, live stock, dairy products, and miscellaneous products for each county in the State and on the imports and exports of Florida.

Agricultural returns for Great Britain, 1902 (*London: Bd. Agr., 1903, pp. VII+33*).—Tables are given showing the total produce and yield per acre of the principal crops in each county of Great Britain with summaries for the United Kingdom.

General index to the reports and bulletins of the experimental farms of the Dominion of Canada, 1887–1901 (*Ottawa, 1902, pp. 194*).

NOTES.

CONNECTICUT STORRS STATION.—At a recent meeting of the board of control L. A. Clinton, who for the past year has been serving as acting director of the station, was made director.

FLORIDA UNIVERSITY.—The State legislature has changed the name of the Florida Agricultural College to University of Florida.

HAWAII STATION.—The station has begun an extensive series of experiments with tomatoes to try to overcome some of the very serious difficulties of growing this vegetable in the Tropics. The experiments include methods of culture, tests of varieties, protection from insects, etc.

ILLINOIS UNIVERSITY AND STATION.—The Illinois general assembly has made an appropriation of $135,000 per annum for two years for the support of the college of agriculture and experiment station. The appropriation is more than double that for the two preceding years and is distributed as follows: For instruction, equipment, and buildings, $50,000; live-stock investigations, $25,000; soil investigations, $25,000; dairy investigations, $15,000; horticultural investigations, $10,000, and corn investigations, $10,000.

KANSAS STATION.—O. H. Elling, a graduate of the college, has been appointed foreman at the Fort Hays Branch Experiment Station.

MAINE STATION.—Horace W. Britcher, assistant zoologist of the station, died April 30, after a lingering illness. He had just returned from Arizona, where he had gone in the hope that the climate might prove beneficial.

MISSOURI UNIVERSITY AND STATION.—Howard S. Reed, B. A., of the University of Michigan, has been appointed instructor in botany in the university and assistant botanist to the station, and G. S. Reeves, B. S., laboratory assistant in entomology, University of Illinois, has been appointed instructor in entomology in the university and assistant entomologist to the station.

MONTANA STATION.—At a recent meeting of the executive board S. Fortier, the director of the station, was granted one year's leave of absence for the purpose of studying the irrigation conditions in California in connection with the irrigation investigations of this Department.

NEW HAMPSHIRE COLLEGE AND STATION.—H. M. Tucker has resigned his position as superintendent of the farm.

NEW MEXICO COLLEGE AND STATION.—R. F. Hare, assistant chemist, has been placed in charge of the chemical work of the college and station until July 1. The legislature has made an appropriation of $25,000 for buildings and has increased the tax levy for the support of the college from one-fifth to two-fifths of a mill. Farmers' institute work has recently been organized and institutes held in three localities, with very gratifying results. Experiments at the station in pumping water from a 6-inch well for irrigation and other purposes have been very successful. A 12-inch well is now being sunk for further experiments in pumping, and measuring weirs and a water register for the study of the duty of water have been installed.

Cornell University.—T. F. Hunt, dean of the college of agriculture of the Ohio State University, has been elected professor of agronomy.

Ohio Station.—The station has been provided with a complete outfit for electrotyping and printing, and is now printing its own publications.

Rhode Island College and Station.—An appropriation of $3,000 for one year has been made for student labor and for agricultural demonstrations. A laboratory for the study of animal diseases, particularly poultry diseases, is being fitted up by the station, and additions are being made to the poultry plant for the purpose of facilitating studies of the blackhead disease of turkeys.

South Carolina College and Station.—Committees have been appointed by the board of trustees for the purpose of securing plans for an agricultural building, including a pathological laboratory for the division of botany and bacteriology, and an insectary for the division of entomology, an iron-frame greenhouse, a building for the Young Men's Christian Association, and a gymnasium.

South Dakota Station.—The work of testing cereals in cooperation with this Department which has been conducted at Mellette for the past two years has been transferred to the substation at Highmore on account of advantages of the latter as regards location and climate. The highest market price ($7.25 per hundred live weight, shorn) was recently received at Chicago for lambs fed at the station.

Wisconsin University.—Charles R. Van Hise, professor of geology, has been elected president of the university. His new duties will begin with the next academic year.

U. S. Department of Agriculture.—C. B. Simpson, investigator, Division of Entomology, has been appointed entomologist in the Transvaal department of agriculture. The appointment is for three years beginning July 1. E. S. G. Titus has been appointed to fill the vacancy in the Division.

Carnegie Institution.—The first Yearbook of the Carnegie Institution of Washington has recently been issued. It constitutes a volume of over 300 pages and contains an account of the work of the institution for the year 1902. The first part of the volume is devoted to a reproduction of the articles of incorporation and by-laws of the institution, together with the trust deed of Mr. Carnegie, the minutes of the meetings of the incorporators of the institution and of the board of trustees, and the proceedings of the executive committee. The greater part of the volume is occupied with reports of advisory committees who were consulted with regard to problems in various lines of research which might well be encouraged and supported by the Carnegie Institution. The volume contains reports from advisory committees on the following subjects: Economics, botany, physics, geology, geophysics, geography, meteorology, chemistry, astronomy, paleontology, zoology, physiology, anthropology, bibliography, engineering, psychology, history, and mathematics. The lines of work which are recommended by the various advisory committees are much diversified and cover very wide fields of research. In a summary of the plans and methods thus far agreed upon it is stated that it is within the purpose of the Carnegie Institution to encourage any branch of science, but that efforts will be made to secure cooperation with other institutions and to direct the energies of the Carnegie Institution in such manner as not to interfere or compete with the work of other agencies or institutions. It is stated that specific grants will be made for different purposes to individual investigators, and these grants may be used for any purpose necessary for the prosecution of the work undertaken by the different investigators. In the appendix to the volume detailed accounts are presented of a number of proposed biological explorations and investigations on a large scale. These include a biological survey of the Palearctic region, South and Central America, the establishment

of biological experiment stations for studying evolution and other problems, an antarctic expedition, and an investigation of subterranean temperatures. The funds required for all these proposed lines of research would be far in excess of those at the disposal of the institution, and attention will therefore be concentrated upon the selection of certain problems which appear to require immediate assistance.

National Farm School at Doylestown.—The bill relating to this school as finally passed by the Pennsylvania legislature and signed by the governor carried an appropriation of $10,000 for the biennial period instead of $15,000 as previously announced. The post-office address of this school is Farm School, Bucks County, Pa.

American Chemical Society.—The Society will hold its twenty-eighth general meeting at Cleveland, Ohio, June 29 and 30, 1903. In the announcement of the meeting the attention of those who will present papers is called to the desirability in most cases of a brief, clear presentation of results rather than technical details which, though very suitable in published papers, are generally out of place in meetings of this kind in which the time available for the presentation of papers is usually limited.

Miscellaneous.—The legislature of Hawaii at its recent regular session provided for a reorganization of the office of the commissioner of agriculture by placing the duties of that office under the control of a nonsalaried board of five commissioners. The new law defines the duties of the board and provides for the enforcement of its regulations. Under the new arrangement particular attention of the board is given to forestry, entomology, and inspection of plants, fruits, etc., to prevent the admission of injurious fungi and insects. For this work paid superintendents and assistants are provided. For the development of general agriculture, cooperation with the experiment station established by this Department is to be sought, and such an arrangement can hardly fail to be of benefit to the station as well as to the islands.

The Connecticut Agricultural College announces a summer school for teachers and others in nature and country life, to be held at Storrs, Conn., from July 6 to 28. The work will consist of lectures and field and laboratory studies. The subjects offered for instruction include birds, insects, geology, botany, landscape gardening, forestry, flower growing, soils, farm crops, fruits, vegetable growing, farm animals, stock feeding, milk production, poultry, natural science, and the pedagogy of nature study.

The first edition of *El Cafetal*, a monthly review devoted exclusively to the coffee industry in all its branches, appeared April 1. It is a journal of about 20 pages and is published in Spanish at the Produce Exchange Building, New York, in the interests of coffee producers of the Latin-American countries.

The first number of a new veterinary periodical entitled *Fortschritte der Veterinär-Hygiene* was issued in April of the present year. The ground which will be covered by this periodical includes the whole field of veterinary hygiene, and the periodical will include original articles and abstracts.

Dr. Michael Woronin, the well-known Russian botanist, died in St. Petersburg March 5, 1903, in his sixty-fifth year.

EXPERIMENT STATION RECORD.

VOL. XIV. JULY, 1903. No. 11.

The plans for the exhibit of the colleges of agriculture and mechanic arts and the experiment stations at St. Louis next year are now taking sufficiently definite form so that an outline of the proposed exhibit can be given. The general committee has held two meetings, one on the grounds at St. Louis, and the subcommittees have been industriously working out the details of their respective parts. At a meeting of the full committee at Columbus June 20 the general plan and many of the details were formally adopted.

The exhibit will aim to show in a quite comprehensive way the methods and results of work of the colleges and stations, with a view to bringing out the characteristic features which distinguish them from other educational and research institutions, and the extent and scope of their fields. To this end the exhibit will be a collective one, in the sense that the work of the various institutions will be shown collectively rather than in the form of individual exhibits by the different colleges. It will thus be essentially a cooperative enterprise between the various institutions, acting through the committee appointed to prepare the exhibit, and will be made up quite largely of materials furnished by the different colleges and stations, classified and arranged so as to form a well-rounded whole. This will prevent duplication, but will in no way detract from the credit given individual institutions.

Strictly speaking, the appropriation of $100,000 made by Congress can not be used for the purchase of exhibits as such, but is intended to pay the expense of assembling, installation, and care. A liberal construction of the act, however, will allow the purchase of certain materials and objects used in the preparation of an exhibit to supplement the assistance given by the institutions themselves, but the amount which it has been possible to set aside for this purpose is relatively small. The committee has already found from its estimates of the necessary expenses for cases, fitting up of laboratories and other features upon the space, the installation and maintenance of the exhibit, the packing and transportation of the materials to and from St. Louis, and other necessary items, that it will be necessary to practice economy in order to accomplish what is desired.

The location decided upon is in the Palace of Education, where very desirable space, comprising about 11,500 square feet, has bee assigned to the committee by the exposition authorities. This spac occupies a conspicuous position in the building, is well lighted, and adjacent to the educational exhibits of several foreign countries. Th division of space as agreed upon gives about 4,000 square feet mechanic arts, 6,000 square feet to agriculture, and 450 square fe each to the Bureau of Education and the Office of Experiment Station

The plans for mechanic arts have not yet been worked out in deta by the subcommittees in charge. In general, the main divisions of th portion will be civil, mechanical, electrical, mining and chemic engineering; architecture, drawing and shop practice; and industri and domestic arts, the latter to include domestic science. A canva has been made of the colleges, which has indicated a large amount material to be available in most of these lines.

The general divisions of the agricultural portion of the exhibit w be plant production, including horticulture and forestry; zootechn including animal husbandry and veterinary science; agrotechny, inclu ing dairying and other lines of agricultural manufactures, such sugar making, wine making, canning, meat products, tobacco, etc rural engineering; and rural economics. There will be no separati of the instruction work from the experiment station work, as w done at Chicago, but the different lines will be united so as to sho their interrelations, and this will frequently avoid duplication. plant production, for instance, the exhibit will show the materials us for instruction as well as the methods and results of investigatio including the study of plant diseases and injurious insects, the inspe tion work, the results of plant breeding, etc. There will be a worki laboratory for soil physics, showing equipment for both instructi and investigation, with exhibitions of typical soils, standard fertilizi materials, methods of studying the fertilizer needs of soils and plan by means of pot culture, etc.

As illustrating the means of instruction in animal husbandry it proposed to show a model class room, equipped with the special pr visions in the way of models, charts, illustrative material, etc., whi experience has suggested as advantageous to this line of instructi This, it is thought, can be made a novel and attractive feature, a serve to show the progress which has been made in adapting and pr viding facilities for class-room work. Another section of this exhi will show the investigation work in the breeding, feeding, and ma agement of animals. This is expected to include a model of t Armsby respiration calorimeter, equipment for digestion work, exa ples of important lines of feeding work with various kinds of live stoc and methods of breeding, together with some of the results, notably w

poultry. The veterinary science laboratory will likewise include both methods of instruction and of research, and will contain illustrations of typical results of the stations' work in study of animal diseases and their control.

Dairying will constitute a prominent feature in point of space and in variety and character of methods and results presented. There will be a working dairy laboratory, together with a model creamery for purposes of instruction. The results of the stations' work in showing the relation of food to quality of dairy products, the effect of micro-organisms, the curing of cheese, and other work relating to the progress of dairying, will be illustrated by specimens, models, and charts. The important work which has been done in sugar production, both from sugar cane and from the sugar beet, as well as the studies on maple sugar, will be shown in a sugar laboratory, adjacent to which other lines of agricultural manufactures will be illustrated.

The exhibit in rural engineering will include the layout of farms, farm buildings and machinery, irrigation, drainage, and road construction. In connection with the irrigation and drainage exhibits experimental and model systems will be shown, with fields arranged to illustrate different methods of irrigation, drains for removing excess of water, and provided with a pumping plant. This should prove one of the most attractive and instructive features of the whole exhibit, but from its character need not be very expensive.

One controlling idea which has been borne in mind in planning the exhibit has been to provide as many features as possible which would in a measure be self-explanatory and would attract the attention of the passer-by. The experience of the past has shown that objects, models, and exhibits containing some feature in operation are a more successful means of illustration than charts and diagrams, although it is difficult to fully illustrate some lines of station work without the latter. Frequently some feature can be used to attract the attention, which can then be led to a more detailed presentation. Several attendants to act as demonstrators are planned for.

In addition to the exhibit in the Palace of Education, the exposition authorities have agreed to provide a building where the work in animal husbandry, especially in stock judging, can be shown. This will consist of a stock-judging room where the work can actually be carried on with provision for block tests, the cutting up of beef, cooking tests, etc. A considerable sum of money has been set apart by the committee for the purposes of this exhibit outside the education building.

The plans for the preparation of the exhibit include the collaboration of the Office with the central office of the committee. In the case of certain laboratories and parts of the exhibit the assembling of the materials, and in general the method of presentation, will be assigned

to experts, who will act in collaboration with the committee. Definite requests will be made of individual institutions for contributions in their respective specialties.

The exhibit at St. Louis will differ in some respects from any previous exhibit which our colleges and stations have made. The first undertaking of the kind was at Chicago ten years ago on a considerably smaller space. At that time the whole exhibit was placed in the agricultural building. The much smaller exhibits which have been since made at Buffalo, Paris, and Charleston have related very largely to the experiment station work, and have likewise been classed with the agricultural exhibits. The change of location to the education building therefore makes a new departure, the reasons for which may not at once be patent.

There can be little question regarding the desirability of classifying that portion of the exhibit relating to the land-grant colleges in the education building. The stations are legally, and actually for the most part, departments of these colleges; and, furthermore, the experiment station exhibits of the foreign countries will be made in the education building in connection with their educational exhibits.

But there is still another reason. While the work of the experiment station touches agricultural practice on the one hand, and this relationship has been most often emphasized, it also touches agricultural education on the other. It has been referred to as constituting the capstone of agricultural education, and it quite as truly furnishes the foundation for it. Indeed it is on its educational side that the experiment station movement is destined to exert its most profound and permanent influence; for the investigations and experiments of the stations not only provide much material for effective courses of instruction in the theory and art of agriculture, but they also furnish to the farmer the hitherto lacking motive for definite technical education along the lines of his art. This is changing the intellectual attitude of the farmer from conservatism to progressiveness.

The experiment station work in its practical application has already won its way with the farmers of the country, and its utility needs no further demonstration or advertising. But there has been a desire on the part of many to bring out its broader relations and its position in the whole system of agricultural education, which is not so generally realized and appreciated. The St. Louis Exposition has been thought to furnish a good opportunity for enforcing this conception of the stations. The leading purpose of the whole exhibit is to show the strong place which the land-grant colleges and the experiment stations have taken in our educational system. If it can once be made clear and apparent that agriculture has a pedagogic form, then educators

can be looked to to take it up and provide a place for it in the general scheme, from the common school to the higher institutions of learning, and the interest and support of teachers can be invoked.

This result is a most desirable one from the experiment station standpoint. A better educated rural population will be better able to make use of the experiment station work. The highest use of the experiment station must depend upon an educated constituency.

This issue concludes the regular abstract numbers of volume fourteen. Number twelve will, as usual, be devoted to the subject and name index to the current volume. This is now well under way and will be issued as speedily as possible.

The revision of the manuscript of the general index to the first twelve volumes of the record has proved a more formidable and time-consuming task than was anticipated. The work has not been allowed to lag, however, but has been pushed forward unremittingly during the past winter and spring. It is a pleasure to state that this index is now approaching completion and will soon be ready for the printer.

RECENT WORK IN AGRICULTURAL SCIENCE.

CHEMISTRY.

Improved method for separation and determination of total alkalis in soils, J. H. PETIT (*Jour. Amer. Chem. Soc., 25 (1903), No. 5, pp. 496–498*).—To avoid error due to presence of barium carbonate the official method is modified as follows: "Just previous to evaporating the solution of the chlorids in platinum dishes a few cubic centimeters of an ammonium sulphate solution—75 gm. to the liter—are added. The precipitate is filtered and the filtrate evaporated, as usual, in platinum dishes and ignited. In this way the barium is completely removed at one operation and the alkalis are changed into sulphates, which can be ignited over the full heat of the Bunsen burner without danger of loss through volatilization. . . . After igniting to a red heat about 1 gm. of dry, powdered ammonium carbonate is added to the dish and volatilized, thus breaking up any acid sulphates which may have formed."

The solubility of barium sulphate in ferric chlorid, aluminum chlorid, and magnesium chlorid, G. S. FRAPS (*North Carolina Sta. Rpt. 1902, pp. 50–52*).—The results of tests made by the author at room temperature and compared with results obtained by Fresenius show that barium sulphate is much less soluble in a 10 per cent solution of ferric chlorid or aluminum chlorid than in 10 per cent nitric or hydrochloric acid, but more readily soluble in a 10 per cent solution of ammonium chlorid than in a 10 per cent solution of ferric chlorid or aluminum chlorid. In the presence of barium chlorid barium sulphate was found to be less soluble in ferric chlorid or aluminum chlorid than in 10 or 2.5 per cent solutions of ammonium chlorid, a 2.5 per cent solution of sodium chlorid, nitric acid, or hydrochloric acid.

Methods for the determination of total phosphoric acid and potash in soils, C. B. WILLIAMS (*Jour. Amer. Chem. Soc., 25 (1903), No. 5, pp. 491–496*).—See E. S. R., 14, p. 630.

The determination of citric-acid-soluble phosphoric acid, R. WOY (*Chem. Ztg., 27 (1903), No. 24, pp. 279, 280*).—The author briefly reviews recent literature on this subject, especially that tending to show the superiority of his method (E. S. R., 9, p. 321) over that of Böttcher as regards accuracy. Some modifications of the method are described.

The determination of citric-acid-soluble phosphoric acid in Thomas slag, O. BÖTTCHER (*Chem. Ztg., 27 (1903), No. 22, pp. 247, 248*).—Further studies of the applicability and advantages of the author's preliminary test for silica in slags (E. S. R., 14, p. 834) are reported.

A quick practical method for determining the amount of acid required in the preparation of superphosphates, W. STRZODA (*Chem. Ztg., 27 (1903), No. 38, p. 299*).—To 20 gm. of the phosphate or fertilizer mixture 30 cc. of crude sulphuric acid about 53° B. is added, the mixture shaken, and allowed to stand ½ hour in a warm place (50 to 80° C.). The volume is made to 1 liter and free acid determined by titration. Knowing the exact strength of the original acid, the results thus obtained furnish data for calculating the acid required for reducing the phosphate.

The determination of nitrogen in nitrates and nitric-acid esters, A. Wohl and O. Poppenberg (*Ber. Deut. Chem. Gesell., 36 (1903), pp. 676–684; abs. in Chem. Centbl., 1903, I, No. 15, p. 893; Jour. Chem. Soc. London, 84 (1903), No. 486, II, p. 328*).—Nitrogen is determined by decomposing the substance with sulphuric acid and mercury in an exhausted flask, which is thoroughly shaken until the substance is completely dissolved, the pressure in the flask, then being determined by means of a manometer. The most serious source of error, the possible formation of oximes, is overcome by adding chromic acid to the sulphuric acid. Various corrections which should be applied are given.

On the determination of organic nitrogen in the presence of nitric nitrogen, A. Quartaroli (*Staz. Sper. Agr. Ital., 36 (1903), No. 1, pp. 47–51*).—In the method proposed 1 gm. of substance is treated with 10 cc. of formic acid in a flask and 5 cc. of concentrated sulphuric acid is slowly added in the cold with constant stirring, the operation being continued in a Schultze-Tiemann apparatus in the usual way.

A burette and standard solutions convenient for the determination of nitrogen by the Kjeldahl method, A. W. Bosworth (*Jour. Amer. Chem. Soc., 25 (1903), No. 5, pp. 535–537*).—Using 1 gm. of substance for the determination, the distillate is collected in 8 cc. of $\frac{1}{2}$-normal sulphuric or hydrochloric acid. This is titrated with 14.04-normal alkali, which is run in from a burette graduated in reverse order; that is, the zero point is the lowest mark. This burette is filled at the beginning to the 56.16 cc. mark, and the readings give percentages of nitrogen multiplied by 10.

The estimation of small amounts of carbon monoxid in the air, Spitta (*Arch. Hyg., 46 (1903), No. 3, pp. 284–310, fig. 1*).—The method proposed depends upon the oxidation of the carbon monoxid to dioxid in the presence of added hydrogen, by means of palladium heated by an electric current.

The distribution of arsenic in nature, F. Garrigou (*Compt. Rend. Acad. Sci. Paris, 135 (1902), No. 24, pp. 1113–1115*).

The determination of sulphur in plants, G. S. Fraps (*North Carolina Sta. Rpt. 1902, pp. 42, 43*).—Since this article was originally published (E. S. R., 13, p. 916) it has been found more satisfactory, as stated in a note, to substitute calcium acetate for potassium nitrate in the preparation of the ash.

The determination of sulphur and chlorin in plants, G. S. Fraps (*North Carolina Sta. Rpt. 1902, pp. 44–49*).—This is a less detailed account of the work presented before the Association of Official Agricultural Chemists in 1902 (E. S. R., 14, p. 114), the results of which were in favor of the nitric acid method, modified by the substitution of calcium acetate for potassium nitrate for the determination of total sulphur, and the method of ignition with sodium carbonate for the determination of chlorin, as compared with several other methods.

The sulphur content of some vegetable materials, W. A. Withers and G. S. Fraps (*North Carolina Sta. Rpt. 1902, pp. 53–58*).—Determinations of the sulphur content of a number of vegetable materials are reported. The authors found that the ash of plants contains only a portion of the total sulphur. The ash of cotton-seed meal was found to contain 1/6, cotton-seed hulls 1/5, oats 1/10, cowpeas 1/6, corn 1/50, peanuts 1/3, and tobacco 4/5 of the total sulphur. The sulphur content was found to be greater than has usually been considered. The sulphur content of an ash is considered no indication of the amount of sulphur in the plant, and conclusions reached by ash analyses as regards the sulphur content of the plant are therefore considered entirely valueless.

The determination of pentosan-free crude fiber, G. S. Fraps (*North Carolina Sta. Rpt. 1902, pp. 59–62*).—This paper was presented before the Association of Official Agricultural Chemists in 1901 (E. S. R., 13, p. 410). The results of tests

show that the König method yields a fiber practically free from pentosans an requires fewer manipulations and less time than the usual method.

Russian export butter and methods of its examination, I. Shirokikh (*Sdsk. Khoz. i Lyesov., 208 (1903), Mar., pp. 691–700*).—It is stated that Russian butter considered very unsatisfactory in England. The author believes that this opinion due to a lack of acquaintance with the composition of the butter and to the prepon derating importance attached to the content of volatile fatty acids to the neglect the content of nonvolatile fatty acids.

The method of determining nonvolatile acids, as elaborated by the author, described. The fat is saponified in the usual manner and the soap is digested on water bath with a 10 per cent solution of tartaric acid until the nonvolatile acids ris to the surface as a transparent layer. The water is practically all expelled by hea ing over a free flame, constant shaking being required to prevent violent bumpin There remains in the flask a crystalline precipitate of potassium acid tartrate, a laye of fatty acids, free tartaric acid, and traces of water. The water is entirely remove by placing the flask for half an hour in the steam drying oven. The flask is coole in a desiccator and ether is added. The extract, which should be transparent an without flakes, is filtered through a dry filter into a weighed flask, and the ether driven off on a water bath. Drying to a constant weight is easily accomplishe The weight represents the percentage of nonvolatile acids in the fat.

Analyses of 5 samples of typical export butter are reported. These show a rang in the water content of from 10.2 to 10.9 per cent; salt content, 0.8 to 3.0 per cen nonvolatile acids, 88.2 to 88.9 per cent; insoluble acids, 85.3 to 87.6 per cent; Reichert Meissl number, 21 to 27.4; saponification equivalent of fat, 216.5 to 229.8; milligram of potassium hydrate required to saturate 1 gm. of the nonvolatile acids obtained b the author's method, 214 to 220, and 1 gm. of the insoluble acids, 206 to 216; iod number of fat, 26.5 to 38.6; iodin number of nonvolatile acids, 26.6 to 38.5; iod number of insoluble acids, 25.5 to 38.9, and the specific gravity of fat, 0.8632 0.8662. The low content of volatile acids is attributed to the method of feeding.—P. Fireman.

Studies of methods of estimating fat in animal substances, W. Glik (*Arch. Physiol. [Pflüger], 95 (1903), No. 3–4, pp. 107–145*).—A comparison of th principal methods of estimating fat in animal materials led to the conclusion that may be most satisfactorily determined by extraction with low-boiling petroleu ether (50 to 60° C.). The lecithin in the extracted fat may be separated by takin advantage of the fact that it is insoluble in aceton.

The estimation of the salicylic acid content of berries and stone fruit, Süss (*Oesterr. Chem. Ztg., 5 (1902), No. 21, p. 488*).—The data noted in a paper pr sented before a meeting of the German Naturalists and Physicians led the author conclude that salicylic acid was not found unless it had been added.

Some of the constituents of cacao and their determination, J. Dekki (*Inaug. Diss., Univ. Bern, 1902, pp. 83*).—An investigation of the various chemic methods of determining different constituents of cacao.

Investigations on Chinese rhubarb, K. Heuberger (*Inaug. Diss., Univ. Ber 1902, pp. 62*).—A chemical investigation of the various constituents of rhubarb.

The hydrolysis of crystallized oxyhemoglobin of horses' blood, E. Abder halden (*Ztschr. Physiol. Chem., 37 (1903), No. 5–6, pp. 484–494*).—Experiments we undertaken to determine the cleavage products of oxyhemoglobin.

The hydrolysis of crystallized serum albumin of horses' blood, E. Abder halden (*Ztschr. Physiol. Chem., 37 (1903), No. 5–6, pp. 495–498*).—A study of th cleavage products of crystallized serum albumin.

The hydrolysis of edestin, E. Abderhalden (*Ztschr. Physiol. Chem., 37 (190 No. 5–6, pp. 499–505*).—Experimental data are reported.

The hydrolysis of zein by hydrochloric acid, L. Langstein (*Ztschr. Physi*

Chem., 37 (1903), No. 5–6, pp. 508–512).—A study of the cleavage products obtained when zein is hydrolized with hydrochloric acid.

Tests and reagents, chemical and microscopical, known by their authors' names, together with an index of subjects, A. I. Cohn (*New York: John Wiley & Sons; London: Chapman & Hall, Ltd., 1903, pp. III+383*).

Report of the chemists, C. H. Jones and B. O. White (*Vermont Sta. Rpt. 1902, pp. 268–271*).—Analyses of 34 miscellaneous samples, including fertilizing materials, wood ashes, muck, and feeding stuffs are reported.

Report on the progress of physical chemistry and physics during the year 1902, M. Rudolphi (*Chem. Ztg., 27 (1903), No. 28, pp. 319–323*).—A review with numerous references to literature.

Proceedings of the nineteenth annual convention of the Association of Official Agricultural Chemists (*U. S. Dept. Agr., Division of Chemistry Bul. 73, pp. 187, pl. 1, figs. 5*).—This account of the proceedings of the meeting held in Washington October 2–4, 1902, is edited by the secretary of the association, H. W. Wiley. For a summary of the proceedings see E. S. R., 14, pp. 107–116. A memoir of the late Robert C. Kedzie, by L. S. Munson, and an article on the determination of glucose by E. Gudeman (E. S. R., 14, p. 224) have been included.

BOTANY.

The variation of reserve carbohydrates in the stem and roots of ligneous plants, Leclerc du Sablon (*Compt. Rend. Acad. Sci. Paris, 135 (1902), No. 20, pp. 866–868*).—The author has made a study of the sugar and starch which are found in the interior of ligneous plants throughout the course of the year. In order that his results might be comparable, plants of the same age and as nearly as possible the same condition were grown under identical conditions. At intervals of about 40 days specimens were removed, thoroughly washed, and the stems and roots examined for their reserve carbohydrates. The variation observed in the stems and roots of chestnut seedlings is shown in the following table:

Variation in the carbohydrates in the stems and roots of chestnut trees.

Date.	Sugar.		Other carbohydrates.		Total carbohydrates.	
	Stems.	Roots.	Stems.	Roots.	Stems.	Roots.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
January 11	4.0	1.9	20.7	25.3	24.7	27.2
February 26	4.3	4.7	20.4	21.0	24.7	25.9
March 28	2.7	3.3	18.8	21.4	21.5	24.7
May 20	2.3	3.1	17.6	16.7	19.9	19.8
June 22	2.1	3.6	18.3	18.2	20.4	21.8
July 27	2.6	3.6	18.5	20.7	21.1	24.3
September 12	2.2	1.8	23.7	28.5	25.9	30.3
October 19	2.2	1.6	24.2	27.5	26.4	29.1
November 22	3.2	1.1	21.5	27.8	24.7	28.9
December 26	3.7	1.9	19.3	25.4	23.0	27.3

From this table it is shown that during the winter, when growth is apparently suspended, the total reserves diminish gradually, and in general the root contains more reserve material than the stem. This difference, however, is more apparent in autumn and winter than in the summer. The roots contained more sugar during the period of active growth, and the stems contained their highest proportion during the resting period of the plant. Pear, peach, quince, and alder trees were examined in a similar way, and the results obtained are comparable with those given above.

A study of the reserve carbohydrates of some palms, E. Liénard (*Compt. Rend. Acad. Sci. Paris, 135 (1902), No. 15, pp. 593–595*).—A study is reported on certain reserve carbohydrates found in the endosperm of a number of palms. The

author finds that of the species studied the reserve material consists of small quanti ties of reducing sugars, saccharose, mannan, and galactan.

Formation of albumen by the higher plants in the dark, I. Shtilov (*Izv. Moscow Selsk. Khoz. Inst.* [*Ann. Inst. Agron. Moscou*], *8 (1902), pt. 4, pp. 410–412*).—The experiments of the author were made with beets in glass vessels. In each ves sel, provided with sand fertilized with a mixture of nutritive salts (without nitro gen), was planted 1 beet root. After 14 days 4 roots were taken out, 4 more afte 24 days, 2 after 34 days, and 1 after 44 days, and the total nitrogen determined b the Kjeldahl method and the albuminoid nitrogen after Stutzer. The results wer as follows:

Relation of albuminoid to total nitrogen in plants grown in the dark.

	Roots not sprouted.	Sprouted roots, after—			
		14 days.	24 days.	34 days.	44 days
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent*
Total nitrogen	1.255	1.700	1.620	1.495	1.8
Albuminoid nitrogen	.560	.805	.820	.880	.9
Proportion of albuminoid to total nitrogen	44.620	47.350	50.620	58.860	51.9

These results seem, in the opinion of the author, to show beyond a doubt th possibility of the formation of albumen by the green plants when growing in th dark.—P. FIREMAN.

The influence of organic materials on the development and structure c certain plants, J. Laurent (*Compt. Rend. Acad. Sci. Paris, 135 (1902), No. 20, pp 870–872*).—A report is given of studies with peas, lentils, maize, and rye in which glu cose and glycerin were added to the culture solution in which the plants were grown It was found that if the solutions of glucose and glycerin were isotonic they gav comparable results so far as the development and external characteristics of th plants were concerned. The osmotic pressure not only produced modifications, bu each species exercised a specific influence. The diameter of the cells increased wit the osmotic pressure of the culture medium, the phenomena being most apparent i the solutions of glycerin where the cells of the corticle parenchyma increased muc more rapidly and assumed a nearly spherical form. Solutions of glucose and sacch rose in general produced a thickening and lignification of the cells. The gluco was not only used for the growth of the membranes, but also the reserve starc which had accumulated in different parts of the tissues. The reserve materials we found most abundant in those plants grown in cultures containing the glycerin; o the contrary, the lignification was less noticeable and the differentiation of tissu occurred much later. This is particularly true of the ligneous plants by which great part of the glycerin was absorbed and utilized. In the case of maize, starc was not accumulated either in the roots or the stems and the glycerin was us immediately. In this case the glycerin favored the thickening of the cell membran and lignification of the tissues.

The germination of pollen in the presence of stigmas, P. P. Richer (*Comp Rend. Acad. Sci. Paris, 135 (1902), No. 16, pp. 634–636*).—On account of its possib bearing on the limits of the production of plant hybrids the author made a study the germination of pollen grains when in the presence of stigmas. A large numb of species were examined and it was found that many kinds of pollen which cou not be made to germinate either in water or sugar solutions readily sent out the pollen tubes if fragments of stigmas of the same or nearly related species were add to the cultures. While a few exceptions were noted it was only when the stigmas the same or nearly related species were added that germination took place. Fro

this fact the author concludes that the stigmas of plants secrete substances which favor the germination of the pollen of related species and prevent that of very dissimilar ones.

Canadian experiments with Nitragin for promoting the growth of legumes, F. T. Shutt and A. T. Charron (*Proc. and Trans. Roy. Soc. Canada, 2. ser., 6 (1900), Sec. III, pp. 55–70, pls. 2*).—A brief review is given of the subject of nitrogen assimilation by leguminous plants, and the efforts that have been made in the preparation of pure cultures of the nitrogen-assimilating organisms are described. The authors conducted a series of experiments at the experimental farm, Ottawa, with Nitragin, using a preparation for clover, horse beans, alfalfa, vetches, and peas. The results with clover, peas, and horse beans are described at considerable length. The experiments, with the exception of the horse beans, were on the whole satisfactory and furnished evidence as to the value of this inoculating material. The experiments with clover and peas invariably gave higher yields for treated plats when compared with those grown in similar soils and under like conditions except as to inoculation. The vitality of the bacteria in the culture medium is the most serious detriment to its use. These organisms are particularly susceptible to temperatures above 100° F. as well as to strong light, and their vitality can not be guaranteed for more than about 6 weeks from the time of preparation. For this reason it is considered doubtful whether the use of Nitragin will ever come into general practice by farmers.

Photosynthesis without living plants, L. Macchiati (*Rev. Gén. Bot., 15 (1903), No. 169, pp. 20–25, figs. 2*).—The author briefly reviews the published results of a number of investigators on the possibility of enzyms being concerned in photosynthesis, after which he describes experiments which seem to indicate that these ferments have an important bearing upon the subject of photosynthesis. After carefully washing leaves in distilled water, a glycerin extract was made which when shaken with benzin gave an amorphous, flocculent precipitate, recognized as the enzym present in the leaves. At the same time the leaves were washed, and after drying for 3 hours at a temperature of 100° C. were finely powdered, and part of the powder was again extracted with glycerin. This yielded an enzym similar to that taken from the living leaves. Both the enzyms and the dried, powdered leaves were subjected to experiments to demonstrate their ability to carry on photosynthesis. As a result of numerous experiments the author found that the glycerin extract alone was unable to accomplish any photosynthesis, but the powdered leaves containing the enzym, either alone or when the glycerin extract was added to them, were able to liberate oxygen forming formaldehyde. These experiments, the author believes, indicate that photosynthesis is due to the presence of a soluble ferment and the chlorophyll acts simply as a chemical screen or a sensibilizer.

A preliminary account of this investigation is given in *Compt. Rend. Acad. Sci. Paris, 135 (1902), No. 24, pp. 1128, 1129.*

Methods in plant physiology, H. S. Reed (*Jour. Appl. Micros. and Lab. Methods, 5 (1902), Nos. 10, pp. 2004–2006; 11, pp. 2045–2048; 12, pp. 2084, 2085; 6 (1903), Nos. 1, pp. 2127–2129; 2, pp. 2174–2176; 3, pp. 2231–2234, figs. 10*).—The author gives directions for a number of experiments in laboratory investigations on plant nutrition, osmosis, transpiration, photosynthesis, enzyms, etc.

Phyllobiology, A. Hansgirg (*Phyllobiologie. Leipzig: Borntraeger Bros., 1903, pp. XIV+486, figs. 40*).—In this volume the author gives the results of many years' observations on the biological phenomena which are associated with leaves of deciduous plants. The special modifications and adaptations of the leaves of 61 families of plants are described, and their grouping according to ecological types is discussed. The various protective adaptations of young leaves, leaves of seedlings, etc., are treated in a separate chapter.

Reports of Danish experiment stations for plant culture during 1900 and 1901 (*Tidsskr. Landbr. Planteavl, 8 (1902), pp. 194–222; 9 (1902), pp. 141–164*).—

Reports of investigations conducted at the State experiment stations at Vester Hassing, Askov, Tystofte, and Lyngby.

FERMENTATION—BACTERIOLOGY.

Further studies on nitrogen-assimilating bacteria, GERLACH and VOGEL (*Centbl. Bakt. u. Par., 2. Abt., 9 (1902), Nos. 22–23, pp. 817–821; 24, pp. 881–892*).—Experiments are described with *Azotobacter chroococcum* in cultures containing varying amounts of grape sugar. The authors and others had previously shown the possibility of nitrogen assimilation by this and other organisms when grown in nutrient media containing the proper carbohydrates. In the experiments here reported from 1 to 15 gm. of grape sugar were added to each liter of culture medium and after 5 weeks' growth of the organism the nitrogen content was determined by the Kjeldahl method. Uniformly increasing gains are reported for each culture up to the one receiving 12 gm. of grape sugar. Beyond this amount there was a decided falling off in the nitrogen increase. The amount of nitrogen taken from the air by these cultures varied from 7.4 mg. to 127.9 mg. per liter of media. When cultures were used to inoculate soils in which oats, mustard, and carrots were grown there was no gain in the total nitrogen even when cultures were employed that had shown active nitrogen assimilation in the laboratory. In no case was the condition of the plants improved by the inoculation, but in a number of instances decided losses were observed. These experiments were repeated several times in all, 60 pots and 3 different soils being employed.

Some recent investigations in nitrogen assimilation by bacteria without symbiosis, J. VOGEL (*Fühling's Landw. Ztg., 52 (1903), Nos. 5, pp. 178–180; 6, pp. 213–220*).—The results of pot and field tests of the so-called nitrogen assimilating bacteria which do not live symbiotically, particularly of *Azotobacter chroococcum*, are reported. Comparisons are made of the yield, dry matter, and nitrogen content of oats, mustard, and carrots grown in pots and in the field, the soil in each case having received the same kind of complete fertilizer. The effects of inoculating with pure cultures, adding grape sugar to the soils, and the presence of a comparatively large amount of nitrate of soda, were compared. In the pot experiments with oats and mustard increases were noted for the inoculated series, although those pots receiving nitrate of soda gave the largest yields. When subjected to field conditions all inoculated plats gave less yields of dry matter and nitrogen than the uninoculated. In this case the author states that inoculation seemed to have exerted an injurious influence upon the product.

Concerning the specific identity of the tubercle bacteria of the Leguminosæ and the agricultural importance of this subject, H. BUHLERT (*Habilschr. Friedrichs-Univ. Halle, 1902, pp. 55; also Centbl. Bakt. u. Par., 2. Abt., 9 (1902), Nos. 5, pp. 148–153; 6–7, pp. 226–240; 8, pp. 273–285*).—A discussion is given of the relation of tubercle bacteria to leguminous plants and their function in the assimilation of free atmospheric nitrogen. The author reviews the publications of a number of investigators on this subject and gives the results of his studies in which he claims that the bacteria of the root tubercles which are found on many leguminous plants are all identical with *Bacillus radicicola* of Beijerinck. From the root tubercles of some leguminous plants there were found bacteria which seemed to be very much specialized, but this specialization does not extend to differences that may be regarded as specific. The usefulness of bacteria for inoculating purposes is demonstrated, but it is thought to be confined within rather narrow limits. There does not yet appear to be any pure culture preparation that is entirely trustworthy, and on this account the author recommends recourse to soil inoculations to supply the required organism.

A contribution to the Alinit question, S. Severin (*Centbl. Bakt. u. Par., 2. Abt., 9 (1902), Nos. 19, pp. 712–720; 20, pp. 746–756*).—The results of cultures of various forms of Alinit bacteria, in which 2 well-marked varieties of *Bacillus ellenbachensis*, *B. megatherium*, and *B. subtilis* were grown in various media, are given. The author believes these organisms are specifically distinct, and points out some of their most marked differences. The results of culture experiments with commercial Alinit for oats are given in which negative results were obtained.

Bacteria in the soil, B. H. Buxton (*Jour. Appl. Micros. and Lab. Methods, 5 (1902), No. 9, pp. 1975–1980, figs. 5*).—A description is given of methods for separating soil bacteria, their cultivation, and experiments with cultures of bacteria grown upon alfalfa. The article details methods for class demonstration, particularly of the nitrogen-assimilating bacteria.

Photobacteria in chlorophyll investigations, M. W. Beijerinck (*Proc. Sec. Sci. Koninkl. Akad. Wetensch. Amsterdam, 1902, IV, pp. 45–49*).—The value of photobacteria as indicators in investigations of chlorophyll functions is pointed out.

Pseudomonas fragariæ, a bacterium causing a strawberry-like odor, T. Gruber (*Centbl. Bakt. u. Par., 2. Abt., 9 (1902), No. 19, pp. 705–712, pls. 2*).—A description is given of a species of bacteria which was isolated from fodder beets and cultivated upon various media. The organism produces a very pronounced strawberry-like odor, from which fact it derives its name.

The bacterial flora of the acid fermentation of some foods and condiments, R. Weiss (*Arb. Bakt. Inst. Hochschule, Karlsruhe, 2 (1902), p. 165; abs. in Centbl. Bakt. u. Par., 2. Abt., 9 (1902), No. 22–23, pp. 844, 845*).—The results of extensive studies of various plant and animal foods which have undergone fermentation are given. Particular attention is paid to the bacteria concerned in this fermentation, and 16 well known and 49 new species of bacteria were described. The new species, a list of which is given in the abstract, are fully described in the original publication.

Luminous bacteria, J. E. Barnard and A. Macfadyen (*Ann. Bot., 16 (1902), No. 64, pp. 587, 588*).—An abstract is given of a paper read before the British Association for the Advancement of Science at its meeting in 1902, in which an account is given of experiments conducted on luminous bacteria. The authors have found that the phosphorescence produced by various dead objects, such as fish, etc., is due to bacterial forms of life. The bacteria require rather particular and exact conditions in order to exhibit their luminous properties. They must have a suitable nutrient medium containing the proper proportions of various salts. Luminosity on the part of the bacteria appears to be a function of the living cell, and can be readily disturbed by any process which interferes with its vitality. Free oxygen is essential but in the absence of oxygen the organisms continue to live but are nonluminous. The process of lumination is evidently a vital one and is the result of active oxidation occurring within the cell.

The light produced by these organisms was examined with a spectrum and it was found that the spectrum of none of the luminous organisms extended to the red rays, and it may be assumed that there is no heat given off by them. An exposure to the temperature of liquid air did not destroy the luminosity of the organisms, and when triturated at the temperature of liquid air the luminous bacteria were broken up in such a manner as to cease to give off light.

Concerning the mechanism of agglutination, R. G. Smith (*Proc. Linn. Soc. New South Wales, 27 (1902), pt. 1, pp. 66–72*).—A review is given of some recent investigations regarding the mechanism of agglutination in bacteria, and attention is called by the author to a previous publication in which it was shown that the function of salts in promoting agglutination is to attack the precipitate on the bacteria, causing it to become agglutinated or flocculated.

International catalogue of scientific literature. R—Bacteriology (*Internat. Cat. Sci. Lit., 8 (1902), pp. XIV+314*).—This is the first annual issue by the Inter-

national Council of titles of articles and books relating to bacteriology. As mentioned elsewhere (E. S. R., 14, p. 637) it is an outgrowth of the Catalogue of Scientific Papers relating to scientific literature, published by the Royal Society of London. The plan of treatment is similar to that previously described for Botany, an author and subject catalogue being given for the different articles. In all, 2,206 titles are indexed, and for the subject index a decimal system of grouping has been adopted. The value of the catalogue is greatly depreciated by the very evident omission of works by American authors. Only 66 articles and 14 books of authors publishing in the United States during 1901 are listed, and these are distributed through 19 publications. No reference could be found to the work of this Department nor to that of any of the experiment stations, although many contributions were made to bacteriological literature during the year. A saving clause is inserted in the catalogue to the effect that "those portions of the literature of 1901 which are not dealt with in this volume will be included in the volume of Bacteriology which will form a part of the second annual issue of the catalogue." It is to be hoped that a more careful survey of the literature will be given in subsequent volumes.

The practice of industrial fermentation, E. Ozard (*La pratique des fermentations industrielles. Paris: Masson & Co., 1903, pp. 168, figs. 2*).—In this book the author describes the manufacture of alcohol and gives a general account of the various agents used in fermentation. These are considered under the separate headings of yeasts, molds, and diastases, and the advantage accruing from the use of pure cultures is shown. The methods of manufacturing pressed yeast and pure yeasts are described, after which the processes of the fermentation of beets, molasses, potatoes, artichokes, etc., in the preparation for distillation of alcohol, rum, or beer, are described. The subject of the manufacture and use of yeasts in baking is discussed, as well as the use of yeasts in wine making. In the concluding chapter the author describes the process of fermentation in the manufacture of citric acid, gallic acid, and indigo.

Technical mycology: The utilization of micro-organisms in the arts and manufactures, F. Lafar, trans. by C. T. C. Salter (*Philadelphia: J. B. Lippincott Co., 1903, Vol. II, pt. 1, pp. VIII+189, figs. 68*).—This is in continuation of Lafar's work on technical mycology, the first volume of which appeared in 1898 (E. S. R., 10, p. 520), and is the first part of the volume treating of Eumycetic fermentation. The general morphology and physiology of the Eumycetes are described, in which the chemical composition, action of mineral nutrients, stimulative influences, presence and action of enzyms in this group of ferments are discussed in detail. Fermentation by the Zygomycetes is discussed, the morphology, physiology, and fermentation by Mucor, Rhizopus and related organisms being treated. The use of some of these, such as the Chinese yeasts, *M. rouxii* and *Amylomyces* sp., in the fermentation of various kinds of spirits is described. The concluding portion of the book treats of the Saccharomyces, the morphology, life history, and anatomy of the yeast cell being fully discussed. With the concluding part of this volume, which is promised by the publishers as soon as the proofs are received from the author, this volume will supplement the first, which treats of the Schizomycetes and their use in the arts and manufactures. The recent advances in applied biology can hardly be appreciated until brought together in some such work as this, and Doctor Lafar has well performed his task.

The general theory of the action of diastases, V. Henri (*Compt. Rend. Acad. Sci. Paris, 135 (1902), No. 21, pp. 916–919*).—The action of diastases is said in many respects to be similar to that produced by acids acting upon carbohydrates. The author has studied the action of invertin, emulsin, and amylase on various carbohydrates, from which he concludes that when the rapidity of inversion of saccharose is studied it is found that for a given amount of diastase the rate of inversion increases more rapidly than the strength of solution decreases below 0.1 normal, but if the strength of solution is increased beyond 0.1 normal the rate is independent of the concentration of solution. The result is the same for the action of emulsin on

salicin and for amylase on starch or dextrin. The rapidity of inversion for invertin, emulsin, and amylase is proportional to the quantity of the ferment present. The addition of invert sugar to a mixture of saccharose and invertin checks the action of the diastase, and this is believed to be due to the levulose which is contained in the invert sugar. When a certain quantity of saligénin and glucose is added to salicin and emulsin the rapidity of inversion is checked in proportion as the amount of salicin is reduced. In a similar way a mixture of starch and amylase reduces the hydrolysis of starch. If the inversion of saccharose by invertin be carefully followed through, the reaction will be found to obey the same laws as those governing the inversion by acids. In the case of inversion of saccharose the action is more rapid than that by acids, and the hydrolysis of salicin by emulsion takes place more slowly. A theoretical discussion is given of the action of these different ferments.

Proteolytic enzyms in plants, S. H. Vines (*Ann. Bot., 17 (1903), No. 65, pp. 237–264*).—Since the publication of the author's paper on tryptophane (E. S. R., 14, p. 335) he has continued his observations on the distribution of proteolytic ferments in plants. There appear, from direct and indirect evidence, to be enzyms capable of digesting proteids in certain algæ, some fungi, and various flowering plants. In all cases the process involves the peptonization of the more complex proteids and the proteolysis of the simpler ones. The author's investigations were made with the proteids found normally in the tissues of the plant or upon the Witte-peptone, the object sought being a proteolytic enzym and not a hydrolyzing one. The color test for tryptophane was employed as in the previous investigations, and a large number of fungi, seeds, fruits, latex-bearing plants, stems, leaves, bulbs, tubers, and roots were examined. He found tryptophane present in the expressed juice or watery extracts of banana, melon, ripe cucumber (but not in the green one), vegetable marrow, tomato, onion bulb, and turnip root, but not in the juice of the orange, apple, or grape, nor in the extracts of tubers of potato and Jerusalem artichoke, or green peas, wheat seedlings, or any shoots or leaves examined. The substance has also been found in the milk of cocoanut, in extracts made from bean and pea seedlings, but not in seedlings of maize apart from the seed nor in asparagus, potato, or Jerusalem artichoke shoots, although it was found present in the potato shoots after they had turned green as the result of exposure to light. In the case of the fruits the author believes that tryptophane is certainly associated with the process of ripening and in the case of seedlings with the presence of a supply of reserve proteids.

In summarizing his results, it is claimed that the juices or tissues of various parts of plants act upon proteids so as to give rise to substances having a reaction similar to that of tryptophane. So far the author has been unable to isolate the substance, but he concludes that from the reaction shown by his experiments there is such a chemical substance as tryptophane. The experiments cited above are held to indicate that the vegetable substances showed the effect of proteolysis, which is to be ascribed to a proteolytic enzym contained in the juices or tissues themselves. The distribution of this substance in various orders of plants is briefly summarized, and the author emphasizes the fact that the results given in his paper must be taken as applied only to the particular season of the year during which the experiments were performed.

The growth and reproduction of Amylomyces rouxii, J. Turquet (*Compt. Rend. Acad. Sci. Paris, 135 (1902), No. 21, pp. 912–915*).—The results of investigation as the growth and reproduction of the fungus commonly known as Chinese yeast is reported. The author reports that this fungus possesses not only an asexual method of reproduction, but forms spores in the mycelial filaments. These spores are carried at the ends of the filaments, the mode of production being similar to that in Mucor. So far as his cultures are concerned, the author did not observe the formation of any zygospores. From its mode of growth and asexual reproduction he believes that *Amylomyces rouxii* ought to be included in the genus Mucor and placed near *M. racemosus*.

ZOOLOGY.

A biological reconnoissance in the vicinity of Flathead Lake, M. J. Elrod (*Univ. Montana Bul. 10, pp. 89–182, pls. 30, figs. 3*).—This bulletin contains a description of the region about Flathead Lake, together with notes on the animals and plants which are to be found in that locality. Collections of mollusks, insects, and birds have been made and brief notes are given on the species collected. Among the miscellaneous material in the bulletin mention should be made of an account of the Flathead buffalo herd, which is maintained under the same conditions as range cattle and which numbers 220 pure-bred buffalo and 65 half breeds.

The thirty-first annual report of the board of directors of the Zoological Society of Philadelphia, A. E. Brown (*Philadelphia: Allen, Lane & Scott, 1903, pp. 42*).—An account is given of the mammals, birds, reptiles, and batrachians in the gardens and menagerie, and of the species which were exhibited during the year for the first time. A list is also presented of animals born in the gardens during the period covered by the report, and notes are also given on the additions to the menagerie during the year. C. B. Penrose presents a list of animals which died during the season, together with notes on the causes of their death. A large percentage of these animals died of some form of tuberculosis.

The flame-breasted robin (Petrœca phænicea), C. French (*Jour. Dept. Agr. Victoria, 1 (1902), No. 9, pp. 906, 907, pl. 1*).—A brief discussion of the habits and food of this species of bird, which is considered as strictly insectivorous and recommended for protection.

The house sparrow, J. Percival (*Jour. Bd. Agr. [London], 9 (1902), No. 3, pp. 338–342*).—Notes are given on the destructive habits of the English sparrow, and this species is compared in its appearance and habits with other related species of sparrows. A scheme of rules is presented suitable for adoption by clubs and societies which may wish to form an organization for the destruction of this bird.

Contributions to the ornithology of São Paulo, H. von Ihering (*Rev. Mus. Paulista, 5 (1902), pp. 261–330*).—Descriptive notes are given on the various families of birds with special mention of the feeding habits of some important species. A list of the birds which occur in the State of São Paulo is appended to the article.

Necessity of a federal game law and the protection of birds, H. von Ihering (*Rev. Mus. Paulista, 5 (1902), pp. 238–260*).—Notes are given on the game birds which are at present protected by law at certain seasons of the year, and attention is called to the difficulties in the proper definition of the term "game" so as to exclude birds which should be protected during the whole season.

Destroying prairie dogs and pocket gophers, D. E. Lantz (*Kansas Sta. Bul. 116, pp. 147–163, figs. 8*).—A copy is given of the State law of Kansas regarding the destruction of prairie dogs and pocket gophers. A circular letter of inquiry was sent out and the answers to this circular furnish the basis for an account of the distribution of these animals. At present it is estimated that the prairie dog villages in the State occupy an area of 2,000,000 acres. Experiments in destroying prairie dogs included the use of traps, fumigation with sulphur fumes and carbon bisulphid, and poisoning with arsenic, corrosive sublimate, barium carbonate, potassium cyanid, and strychnin. The best results were obtained from the use of carbon bisulphid and a proprietary poison formula which contained strychnin. In the destruction of the pocket gopher the author discusses briefly the value of bounties, poisonous gases, trapping, and the use of solid poisons.

Myriapods in the Museum of São Paulo, H. W. Brölemann (*Rev. Mus. Paulista, 5 (1902), pp. 35–237*).—A monographic account of this group of animals. The author presents an analytical key for the determination of genera and species and gives brief economic notes in connection with the numerous species described, a number of which are new.

METEOROLOGY—CLIMATOLOGY.

Report on international cloud observations. I, Historical, general circulation of the atmosphere, H. H. Hildebrandsson (*Rapport sur les observations internationales des nuages. I, Historique, circulation générale de l'atmosphère. Upsala: Wretman, 1903, pp. 48, pls. 22*).—This report contains a brief historical summary of the theories of Dove, Maury, Ferrel, and Thomson regarding the general circulation of the atmosphere and a review of the results of cloud observations at stations in different parts of the world in their bearing on these theories. The results are shown graphically in a series of charts for stations selected because of their position in certain critical latitudes, for example, San José de Costa Rica; "Square No. 3" (Lat. 0 to 10° N., Long. 20 to 30° W.); Manila; Mauritius; San Fernando and Lisbon; Habana; Lahore, Allahabad, and Calcutta; Kurrachee, Bombay, and Cuttack; Blue Hill; Paris; several in England, Germany, and Denmark; Upsala, and others in Sweden; and places in Norway, Siberia, China, Japan, and other regions.

The author's conclusions, as translated by Professor Ward,[a] are as follows: "(1) Above the heat equator and the equatorial calms there is, throughout the year, a current from the east which seems to have very high velocities at great altitudes. (2) Above the trades there is an anti-trade from SW. in the northern, and from NW. in the southern hemisphere. (3) This anti-trade does not extend beyond the polar limit of the trade; it is deflected more and more to the right in the northern, and more and more to the left in the southern hemisphere, and finally becomes a current from the west above the crest of the tropical high pressure belts, where it descends to supply the trades. (4) The districts at the equatorial margin of the trades are partly in the trades and partly in the equatorial calms, according to the season. Above them there is, therefore, an upper monsoon—the anti-trade in winter, and the equatorial current from the east in summer. (5) From the tropical high pressure belts the air pressure on the whole decreases continuously toward the poles, at least to beyond the polar circles. Further, the air of the temperate zone is drawn into a vast 'polar whirl' turning from west to east. This whirling movement seems to be of the same nature as that in an ordinary cyclone. The air of the lower strata approaches the center, while that of the higher strata tends out from the center, and this outward tendency increases with the altitude above sea level as far up as the greatest altitudes from which we have observations. (6) The upper currents of the atmosphere in the temperate zones extend over the tropical high pressure belts, and descend there. (7) The irregularities which are noted at the earth's surface, especially in the regions of the Asian monsoons, as a whole disappear at the lower or intermediate cloud levels. (8) We must entirely abandon the notion of a vertical circulation between tropics and poles which has up to this time been accepted in accordance with the theories of Ferrel and Thomson."

The climate of the Bermuda Islands, A. E. Verrill (*The Bermuda Islands New Haven, Conn.: Author, 1903, pp. 82–91*).—This article is a part of a comprehensive treatise on the Bermuda Islands, published first in the Transactions of the Connecticut Academy of Arts and Sciences, volume 11. The principal factors determining the character of the climate of Bermuda are its insular position and proximity to the Gulf stream. These prevent extremes of temperature and sudden changes.

"The average temperature during the three winter months and March is from 63 to 66° F.; April, about 65.5°; May, 70.5°; June, 76°; July, 80°; August, 81.7°; September, 80°; October, 73.7°; November, 68°. The average for the year is about 70° F., but ranges from 69.5 to 70.5°. But temperatures as low as 50 to 53° are not uncommon in winter; 42° is rarely reached. It is rarely as high as 87° in summer, but the mean relative humidity, during the summer months, ranges from 80 to

[a] Science, n. ser., 17 (1903), No. 436, pp. 752, 753.

91°. . . . The amount of rainfall is large, and it seems to be somewhat larger at Hamilton and Ireland Island than at St. George's. According to Lefroy's tables, covering 11 and 16 years, respectively, it was 54.66 in. at Ireland Island and 48.61 in. at St. George's. The amount near Hamilton in later years usually varied between 58 and 63 in., but in 1898 was only 48.19, and in 1900 it was 67.05 in. The rainfall is usually pretty well distributed throughout the year, but is generally greatest in October and November and least in the summer months, when droughts are not uncommon, but seldom very prolonged. Usually more or less rain falls on from 190 to 207 days; and on at least half of the days of all the months from November to April. But in many cases the rains are mere showers of very brief duration, . . . and in the summer time [the air] is often nearly saturated with moisture, so that it is very oppressive to many persons."

Fogs and hailstorms are rare. Thunderstorms are very common and sometimes violent. High winds are frequent, and destructive hurricanes sometimes occur. Frost, ice, and snow have been observed only a few times in the history of the islands, and no great damage has ever been done by them.

Meteorological observations for 1902 (*Colorado Sta. Rpt. 1902, pp. 153–199, 206–213*).—Tables prepared by R. E. Trimble give daily and monthly summaries of observations during 1902 on temperature, pressure, precipitation, dew point, relative humidity, terrestrial and solar radiation, direction and movement of wind, and occurrence of frost at Fort Collins, Colo.; monthly summaries of similar observations at Rockyford and Cheyenne Wells; and monthly summaries of observations on temperature and precipitation at Long's Peak House near Estes Park (elevation about 9,000 ft.), Gleneyre (elevation about 8,000 ft.), and Cowdrey (formerly Pinkhampton), North Park (elevation 8,400 ft.).

Tables are also given which summarize the monthly and annual precipitation at 7 different places in the State and show the monthly and annual rainfall at Fort Collins for the period from 1872 to 1902 with the normals for that period. The following is a summary of the principal meteorological data reported for Fort Collins: Mean temperature (½ maximum and ½ minimum), 47.4° F.; maximum, 99.6°, August 1; minimum, −31.4°, January 6; precipitation, 18.43 in.; snowfall, 24.6 in.; mean relative humidity, 67 per cent. The normals for this place are, temperature, 46.6° F.; precipitation, 14.66 in.; mean relative humidity, 65.3 per cent.

The weather during the agricultural year 1901–2; rainfall, temperature, and bright sunshine during 1901 (*Jour. Roy. Agr. Soc. England, 63 (1902), pp. 457–469*).—Observations on temperature, rainfall, sunshine, etc., in Great Britain during 1901 and preceding years are reported and the general weather conditions of the different seasons of 1902 are discussed.

The cereal and other crops of Scotland for 1902, and meteorology of the year relative thereto, A. Buchan (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 319–350*).—A summary is given of observations on pressure, temperature, rainfall, cloudiness, direction of wind, etc., during the year, with notes on the general weather conditions during each month and crop and live stock reports from a number of different localities in Scotland.

Variations in rainfall at Hawkesbury Agricultural College, C. T. Musson (*Agr. Gaz. New South Wales, 14 (1903), No. 4, pp. 345–348, pls. 2*).—The results of observations with a series of 50 rain gages are reported, which show considerable variations in rainfall over a very small area. "Even in the case of heavy falls the two edges of an acre of ground, of a square form, might receive rain varying by 20 per cent or more. An accumulation of such variations would mean an important factor in the fortunes of the plant inhabitants, which would be emphasized in cases of where plant water requirements were low with heavy rain or high with least rain, or where soils varied much in texture and in relation to water-carrying capacity."

Analysis of red rain of February 22, R. A. Earp (*Nature [London], 67 (1903), [illegible]*).

No. 1740, pp. 414, 415).—Analysis of a red rain which fell on this date at Buckfastleigh, England, is reported, showing 37 gr. of suspended matter per gallon. This suspended matter dried at 100° C. contained 36.4 per cent of organic matter, 45.6 per per cent silica, 13.6 per cent alumina and iron oxid, 2.4 per cent magnesia, and 2 per cent of unclassified matter.

AIR—WATER—SOILS.

On the proportion of hydrogen in atmospheric air, A. Leduc (*Compt. Rend. Acad. Sci. Paris, 135 (1902), No. 26, pp. 1332, 1333*).—A reply to Gautier, reiterating former conclusions.

A further examination of the objections of A. Leduc regarding the proportion of atmospheric hydrogen, A. Gautier (*Compt. Rend. Acad. Sci. Paris, 136 (1903), No. 1, p. 21*).

Evaporation, R. E. Trimble (*Colorado Sta. Rpt. 1902, pp. 205–218*).—This is a monthly summary of observations during 16 years (1887–1902) on evaporation from a tank on the station grounds at Fort Collins, Colo.

Water supply and prevention of waste in leading European cities, C. O. Johnson (*New York: Merchants' Association of New York, 1903, pp. 289, figs. 2, dgms. 3*).—This contains reports on Glasgow, Liverpool, Manchester, Birmingham, London, Paris, Cologne, and Berlin.

New methods and apparatus for sterilizing water, Kausch (*Centbl. Bakt. u. Par.; 1. Abt., 33 (1903), No. 5–6, Ref., pp. 129–136, figs. 7*).

Report on artesian wells, L. Woolman (*Geol. Survey New Jersey Rpt. 1902, pp. 63–95*).—A collection of data regarding the artesian wells of the State, especially the southern portion, and a record of the more important wells drilled during 1902.

The sinking of subterranean waters and the disappearance of springs, E. A. Martel (*Compt. Rend. Acad. Sci. Paris, 136 (1903), No. 9, pp. 572–575*).

Absorption of ammonia by sea water, J. Thoulet (*Compt. Rend. Acad. Sci. Paris, 136 (1903), No. 7, pp. 477, 478*).

The Murray waters (*Agr. Gaz. New South Wales, 14 (1903), No. 4, pp. 289–309, figs. 31*).—This is an extract from the report of the royal commission and deals with the amount and utilization of the waters of the Murray basin.

A preliminary investigation of the soil and water of the Fayoum Province (*Jour. Khediv. Agr. Soc. and School Agr., 4 (1902), No. 5, pp. 184–188*).—Analyses with reference to alkali content of water, soils, and efflorescences are reported and discussed. Injury from excessive irrigation and defective drainage is pointed out.

On the influence of commercial fertilizers on the water-holding capacity of soils, E. Gross (*Ztschr. Landw. Versuchsw. Oesterr., 6 (1903), No. 1, pp. 80–90, fig. 1*).—The rate of capillary rise of water in sandy soil poor in humus, loam, and humus loam, in cylinders 1 meter long and 10 mm. in diameter, as affected by potassium sulphate, nitrate of soda, superphosphate, and caustic lime mixed with the soil at the rate of 2 per cent is recorded. The results of duplicate tests are summarized in the following table:

Capillary rise of water in soils treated with different kinds of fertilizing materials.

Fertilizing material.	Sandy soil.		Loam.		Humus loam.	
	Rise of water in 21 days.	Rise, assuming unfertilized soil as 100.	Rise of water in 42 days.	Rise, assuming unfertilized soil as 100.	Rise of water in 42 days.	Rise, assuming unfertilized soil as 100.
Unfertilized	55.5	100.0	60.2	100.0	46.2	100.0
Potassium sulphate	62.8	113.1	68.0	112.9	55.5	120.0
Superphosphate	50.8	91.5	70.2	116.6	48.5	104.9
Nitrate of soda	39.8	71.7	55.5	92.1	39.2	84.9
Lime	31.0	55.9	32.0	53.1	32.0	69.2

Soil temperatures (*Colorado Sta. Rpt. 1902, pp. 200–204, 214–217*).—This is a tabulated record, prepared by R. E. Trimble, of weekly observations on soil temperatures at different depths in irrigated and unirrigated soil.

Investigation of Illinois soils, C. G. Hopkins (*Illinois Sta. Circ. 64, pp. 26, figs. 5*).—A report of progress in the general and detailed soil surveys of Illinois carried on under State appropriations. More detailed accounts are to be published later in bulletin form.

The soil of the Bermuda Islands: Its origin and composition, A. E. Verrill (*The Bermuda Islands. New Haven, Conn.: Author, 1903, pp. 78–82*).—In this article, which is part of a comprehensive treatise on the Bermuda Islands, published first in the Transactions of the Connecticut Academy of Arts and Sciences, volume 11, it is stated that "with the exception of the black peat or muck of the swamps and marshes, all of the soil of the islands has been produced as an insoluble residue, or impurity, left after the solution of the limestones and shell-sands of the islands by rain water, but it is usually mixed with more or less disintegrated limestone, and some organic matter. . . . Where the decomposition has been complete, this soil is a reddish clay, the color being due to an excess of iron oxid, but in most places the clay soil is mixed with considerable shell-sand, or grains of undecomposed rock. In many places the latter forms the greater part of the bulk." The latter are the so-called white soils composed largely of calcium carbonate. The historical record of crop production in the islands as well as the analyses reported in this article show the soils to be as a rule naturally very fertile. They have, however, been reduced by years of exhaustive culture. According to the analyses reported the red soils, which are the more important, contain lime, 3.6 to 10 per cent; potash, 0.11 to 0.17 per cent; and phosphoric acid, 0.68 to 0.74 per cent.

On the nature of the nitrogen compounds found at different depths in the soil, G. André (*Compt. Rend. Acad. Sci. Paris, 135 (1902), No. 26, pp. 1353–1355*).—The total and ammoniacal nitrogen obtained by boiling (for 15 hours) samples of soil taken in April and October from the surface and from depths of 30 and 60 to 65 cm. in dilute hydrochloric acid (36 per cent) and potash solution (containing 20 times as much potash as there was nitrogen in the sample of soil) are reported. In case of the treatment with potash the ammonia was removed by means of a current of hydrogen and collected in dilute acid. The results indicate that the insoluble nitrogenous compounds of the surface soil are largely transformed into soluble compounds during the summer and are widely diffused through the deeper layers of the soil during the winter, so that in the spring the lower layers of the soil contain more soluble nitrogen than the surface soil. At the end of summer, however, the distribution is quite uniform in the different layers.

The analysis of reh, the alkaline salts in Indian usar land, E. G. Hill (*Proc. Chem. Soc. [London], 19 (1903), No. 262, pp. 58–61; abs. in Chem. Centbl., 1903, I, No. 17, p. 987*).—The upland usar or alkali lands of India, covering an area of about 2,000,000 acres, mainly between the Jamna and Ganges and also between the Ganges and Gogra, are described, and the attempts to utilize them are referred to. Analyses of 5 samples of the soluble salts or reh are reported and their possible utilization on a large scale is discussed. None of the samples examined contained less than 88 per cent of sodium carbonate.

Investigations on the influence of the volume of soil on the yield and composition of plants, O. Lemmermann (*Jour. Landw., 51 (1903), No. 1, pp. 1–70*).—The yield and composition of mustard grown on mixtures of sand and ordinary soil under different systems of manuring in series of pots containing 30, 22½, and 15 kg. of soil are reported and discussed. The results show that both the yield and composition were affected by the size of the pot, the fertilizer apparently being more thoroughly utilized and the yield being larger in the larger pots.

Nitrification in different soils, W. A. Withers and G. S. Fraps (*North Caroli*

Sta. Rpt. 1902, pp. 31–41).—In continuation of previous work (E. S. R., 13, p. 122), a study was made of the rate of nitrification of ammonium sulphate and cotton-seed meal in 8 soils of known history from different parts of the United States. The results show that "calcium carbonate exerts a decided accelerating influence upon the nitrification of cotton-seed meal and ammonium sulphate, especially the latter. In some soils a greater per cent of nitrogen is nitrified in the form of ammonium sulphate than in cotton-seed meal; in other soils the contrary is the case, even in the presence of calcium carbonate. Other soils exhibited little nitrifying power, under the conditions of the experiments."

FERTILIZERS.

Manures in use in Egypt, G. P. Foaden (*Jour. Khediv. Agr. Soc. and School Agr., 5 (1903), No. 1, pp. 1–34*).—Attention is called to the increasing need for fertilizers in Egypt and the limited supply at hand. In addition to Nile mud, the principal fertilizers available are sebach beladi (barnyard manure), sebach coufri ("the remains of ancient villages mixed with débris of various kinds and organic matter"), tafla or marog (a blue nitrate-bearing clay or marl), pigeon manure, and minor products, such as those derived from sewage, refuse from slaughterhouses, tanneries, street sweepings, etc. The value and use of these manures, as well as of commercial fertilizers, are discussed. Nile water contains on an average in August 170 parts of suspended matter per 100,000, 130 of which is deposited on the soil. This deposit contains on an average 0.1 per cent nitrogen, 0.2 per cent phosphoric acid, 0.6 per cent potash. The sebach coufri generally contains less than 0.3 per cent of nitrogen, 0.5 per cent of phosphoric acid, and 1 to 3 per cent of potash. The tafla or marog is very variable in composition, the content of nitrate of soda varying from 1 to 24 per cent. The average barnyard manure of Egypt contains nitrogen 0.3 per cent, phosphoric acid 0.2 per cent, potash 1.5 per cent.

The results of preservation experiments with barnyard manure stored in heaps, Bachmann (*Deut. Landw. Presse, 30 (1903), Nos. 36, pp. 311, 312; 37, pp. 323, 324*).—Heaps of 1,200 to 1,800 kg. were experimented with. In different cases the heaps were (1) loosely made, (2) closely packed, and (3) closely packed and treated with superphosphate (1½ per cent), phosphoric acid (1½ to 2 per cent), sulphuric acid, marl, ground calcium carbonate (5 per cent), and lime (5 per cent). After standing 4 months manure was removed from each of the heaps for comparative experiments on potatoes and beets. The changes in composition (water, total nitrogen, and ash) after 4 and 8½ months are reported. The loss of nitrogen was rapid for 3 months in the loose heap and then ceased. The loss in closely packed heaps covered with earth was as large as in the loosely made heaps. The superphosphate, phosphoric acid, and sulphuric acid reduced the loss of nitrogen, sulphuric acid apparently being most effective in this respect. Marl, calcium carbonate, and lime increased the loss of nitrogen. The manure treated with superphosphate gave the highest yields, followed in order by that treated with lime, phosphoric acid, calcium carbonate, marl, and sulphuric acid. The results in general show that the larger proportion of the loss of nitrogen occurs in the early stages.

Valuation of unexhausted manures obtained by the consumption of foods by stock, J. A. Voelcker and A. D. Hall (*Jour. Roy. Agr. Soc. England, 63 (1902), pp. 76–114, figs. 3*).—A revision of Lawes and Gilbert's tables using current values of nitrogen, phosphoric acid, and potash in common fertilizers; paying for ½ of the nitrogen, ¾ of the phosphoric acid, and all of the potash in the purchased foods; and reducing the period over which the manure is supposed to produce an effect from 8 to 4 years, the compensation value for the second, third, and fourth years being one-half of that of the year immediately preceding.

The wide variation in the effect of green manures plowed under at differen times, CAUSEMANN (*Deut. Landw. Presse, 30 (1903), No. 31, pp. 263, 264*).—The yiel of the following crop of rye on light sandy soil was in every case larger when lupine were turned under September 28 than when turned under July 31.

Phosphorus versus lime in plant ash, P. Q. KEEGAN (*Nature [London], 6 (1902), No. 1724, p. 655*).—Analyses of the ash of the leaves of a number of plant are reported in support of the view that a certain proportion of lime in the soil (a 3 or 4 per cent) interferes with the assimilation of phosphorus and is so inimica to the life of certain so-called calcifugous plants which require a definite amount phosphorus for the healthy performance of their physiological functions.

An unusual result of fertilizing on a sandy moor soil, CLAUSEN (*Journ. Landw. 51 (1903), No. 1, pp. 77–80, fig. 1*).—Pot experiments are reported in which the yiel of grain of oats was much larger and of straw smaller in case of fertilizer containin no phosphoric acid than in one containing that element. The experiments are to b repeated.

Results of experiments with potash fertilizers on moor meadows, BAC MANN (*Fühling's Landw. Ztg., 52 (1903), No. 7, pp. 251, 252*).—A comparison of kain and 40 per cent potash salt in which the results favored the latter, both as fall appl cation and as spring application. Applications of lime were apparently more ben ficial in case of the kainit than in case of the other salt.

On potash and on alkaline phosphatic nitrogenous bone fertilize J. B. SOBRINHO (*Bol. Agr. São Paulo, 3. ser., 1902, No. 12, pp. 801–806*).—This artic discusses the sources of potash and describes the method devised by Ilienkoff an Engelhardt of the agricultural-chemical institute of St. Petersburg for preparing bon fertilizer by treatment with caustic potash.

The manufacture of animal fertilizers (*L'Engrais, 18 (1903), No. 15, pp 353–355*).—The preparation of fertilizers from by-products of tallow refining, fro poudrette, dried meat and blood, and ground bone is discussed.

Commercial fertilizers, H. A. HUSTON and W. J. JONES, Jr. (*Purdue Univ. Sta Bul., Mar., 1903, pp. 40*).—"This bulletin contains the detailed report and summar of fertilizer inspections made in 1902, the full text of the Indiana fertilizer law, a li of manufacturers who have registered raw materials (nitrogen and potash con pounds), and a list of all fertilizers registered that were on sale April 1, 1903. Analyses of 679 samples are reported.

Analyses of commercial fertilizers, W. C. STUBBS (*Louisiana Stas. Bul. 75, ser., pp. 1–173, 177–189*).—This bulletin gives the text of the State fertilizer law statistics of the fertilizer trade in Louisiana; brief notes on the sources of fertilizin materials, the purchase and valuation of fertilizers; and tabulated analyses of sever thousand samples of fertilizing materials, including mixed fertilizers, acid phosphate cotton-seed meal, bone, tankage, dried blood, nitrate of soda, sulphate of ammoni muriate of potash, sulphate of potash, kainit, bat guano, slag, floats, and boneblac

Inspection of fertilizers in 1902 and analyses of wood ashes and misce laneous fertilizing materials, F. W. MORSE ET AL. (*New Hampshire Sta. Bul. pp. 12*).—Analyses of 81 brands of fertilizers inspected in cooperation with the Sta board of agriculture and 9 samples of ashes, 2 of superphosphate, 1 each of Sou Carolina floats, ground bone, tankage, cotton waste, nitrate of soda, and sulphate potash, 2 of insecticides, and 5 of muck, are reported. The text of the fertilizer la which went into effect in 1901 is given.

Some facts about commercial fertilizers in New York State, L. L. VAN SLY (*New York State Sta. Bul. 230, pp. 18*).—This bulletin discusses the importance of t fertilizer trade in the State and points out "how better economy may be realized purchasing plant foods." The recommendations include (1) the purchase of hig grade fertilizers, and (2) the purchase of unmixed materials. The more economic

sources of phosphoric acid, potash, and nitrogen are pointed out, and illustrations are given of 3 types of plant food mixtures.

Fertilizer analyses, fall season, 1902, B. W. Kilgore (*Bul. North Carolina State Bd. Agr., 24 (1903), No. 2, pp. 43–56*).—Analyses and valuations of 194 samples of fertilizers are reported.

Fertilizer analyses, spring season, 1903, B. W. Kilgore (*Bul. North Carolina State Bd. Agr., 24 (1903), No. 3, p. 31*).—This bulletin reports analyses and valuations of 59 samples of fertilizers.

Analyses of commercial fertilizers, J. L. Hills and C. H. Jones (*Vermont Sta. Bul. 98, pp. 27–48*).—This bulletin gives the main provisions of the fertilizer law as amended by the general assembly of 1902, discusses the valuation of fertilizers, and reports analyses and valuations of 39 samples of fertilizers. A table showing the average composition of different brands examined during the past 5 years is given.

A consideration of water in its relation to the fertilization of the soil, with some analytical studies of the mud of the River Piave, R. Onor (*Staz. Sper. Agr. Ital., 36 (1903), No. 2, pp. 107–132*).

FIELD CROPS.

Report of the agriculturist, A. H. Danielson (*Colorado Sta. Rpt. 1902, pp. 131–136*).—Brief outlines of the different kinds of experimental work with field crops conducted at the station are given. In cooperation with this Department experiments are conducted with sugar beets, grasses and forage plants, and grains, including winter wheats. The other experiments comprise culture and variety tests with wheat, spelt, emmer, einkorn, alfalfa, brome grass, and field beets. Fertilizer tests with nitrate of soda for wheat and oats are also in progress.

Forage crops, grasses, alfalfa, clovers, etc., W. R. Dodson (*Louisiana Stas. Bul. 72, 2. ser., pp. 95, pls. 8*).—Notes are given on the present status and methods of cultivation of a large number of forage plants, including alfalfa, cowpea, Spanish peanuts, lespedeza, red clover, crimson clover, white clover, soy bean, burr clover, velvet bean, hairy vetch, beggar weed, various varieties of sorghum, oats, winter barley, rye, Bermuda grass, carpet grass, large paspalum, crab grass, Italian rye grass, teosinte, redtop, smut grass, Johnson grass, barnyard grass, switch cane, rescue grass, meadow barley, corn stover, dwarf Essex rape, and cassava. The cultivation of alfalfa is gradually becoming more extensive in Louisiana, especially along the Red River bottoms where very favorable conditions are found. The bulletin contains a copy of a paper on alfalfa read before a farmers' institute by W. L. Foster. Experiments with velvet bean showed that both as a forage and a fertilizer crop this plant is fully equal if not superior to cowpea.

Experiments with phosphatic fertilizers in 1900–1901, O. Reitmair (*Ztschr. Landw. Versuchsw. Oesterr., 6 (1903), No. 2, pp. 95–194, map 1*).—The results of extensive cooperative tests with phosphates conducted throughout Austria are given in tables. The method of conducting these tests is described, the use and value of phosphoric acid is discussed, and the general effect of this element in different forms is pointed out. The normal application consisted of 60 kg. of phosphoric acid per hectare. In all tests sulphate of ammonia furnishing 26 kg. of nitrogen and 40 per cent potash salt furnishing 42 kg. of potash per hectare were used.

Winter rye was much more responsive to phosphates than winter wheat. Of the different forms for wheat and rye superphosphate was the most effective. Comparing the results obtained with rye Thomas slag ranked very close to superphosphates in effectiveness and proved even more profitable. These 2 forms were closely followed by Algerian and Belgian phosphates. Of the phosphoric acid furnished in

superphosphate 8.2 per cent was utilized by the crops, and of the quantity given in the other 3 forms 7 per cent was used. Doubling the application of Algerian phosphate gave but a slight increase in yield and was not profitable. The effect of the crude phosphates on rye was quite marked but on wheat it was very slight. From the results with rye the author concludes that 60 kg. of phosphoric acid per hectare is beyond the optimum for all the phosphates used. Winter rye utilized on an average 20 kg. of phosphoric acid per hectare. The quantities taken up by the crop on different plats varied considerably. Owing to this variation in the results with rye and to the limited number of tests with wheat no definite applications are recommended.

The progress of absorption of nitrogen by cereals, J. HENRY (*Bul. Agr. [Brussels], 19 (1903), No. 1, pp. 154–156*).—A record is given of the growth, weight and nitrogen content of barley, wheat, and rye at different periods, which show that the absorption of nitrogen varies widely at different stages. Two periods of maximum absorption were observed in case of wheat, viz, from May 7 to 17 and at the time of the formation of the grain. Similarly for rye the periods of greatest absorption were April 19 to 29 and June 11 to 26 (the time of formation of grain). In case of barley the maximum absorption was at time of heading, June 12 to 26.

Review of agricultural experiments, A. P. AITKEN (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 94–134*).—This is a review of experiments in agriculture which are being carried on by various institutions in Great Britain, with a view to showing the amount and source of this work, the direction it is taking, and the progress which is being made. Special attention is called to the lack of knowledge regarding the soils of the country, and the way in which this affects the experimental work and its interpretation.

Corn experiments in Illinois (*Illinois Sta. Circ. 66, pp. 14*).—This is a report of progress on the different lines of investigation with corn which have been carried on under State appropriations at the station.

The acidity of corn silage, F. W. MORSE (*New Hampshire Sta. Bul. 96, pp. 115–117*).—Analyses are given of several samples of corn silage made from different varieties of corn and analyzed at different times during the years 1895 to 1899. The average total acid content of samples of Sanford corn silage varied from 1.5 per cent acetic acid in 1895 to 1.95 per cent in 1897. With Leaming corn the variations ranged from 0.67 per cent in 1896 to 1.47 per cent in 1897. The average of 5 samples of Mosby Prolific, taken between March 17 to 31, 1896, was 0.82 per cent. Analyses in 1899 of silage made from Leaming corn showed that the acidity of the surface silage was usually lower than that of the silage 6 or 8 in. below the surface, the averages results being 0.83 per cent for surface silage and 1.03 per cent acetic acid for silage not less than 6 in. below the surface.

Cotton culture, R. J. REDDING (*Georgia Sta. Bul. 59, pp. 241–250*).—Experiments similar to those conducted in previous years are reported (E. S. R., 13, p. 1038). In 1902, 26 varieties were under test. Moss Improved, Peterkin Improved, Schley, Allen Prolific, Texas Bur, Woodfin Nonpareil, and Prize, given in the order of the value of total products, head the list in profitable returns, their values ranging from $31.22 to $35.02 per acre. The first 5 varieties mentioned ranked in the same order in the production of lint cotton. Considering the general results for the last 9 years in this line of work, large bolls, large seeds, and a high percentage of lint are closely related to the greatest value of lint and seed. Brief notes on some of the varieties under test are given with directions for selecting a variety and for selecting seed in the field.

As in previous years, a mixture of an early and a late maturing variety was tested. The varieties used this season were Schley and King Improved, of which 15.5 and 10 lbs. of seed per acre, respectively, were planted. King Improved, the early variety, yielded much less than Schley and the mixture was also found unprofitable. Averag

results for 5 years show that the yields per acre of medium varieties were 90 cts. greater in value than the yields of early varieties, while the yields of the mixtures exceeded those of the medium varieties by $1.34. If the 2 varieties are equally productive from year to year it is considered expedient to mix them.

The results of distance experiments conducted for 4 years are in favor of spacing plants 12 in. apart in 4-ft. rows. This test had reference only to the distance between plants in the row. From a series of experiments the author concludes that on upland middle Georgia soils, capable of yielding 800 to 1,200 lbs. of seed cotton per acre, the rows should not be wider than 36 in. and the plants in the row not over 12 in. apart.

An unfavorable season and the appearance of rust interfered with the results of a fertilizer test made for the purpose of determining the best proportion of nitrogen in a mixture containing available phosphoric acid and potash in the constant proportion of 4 : 1. As the nitrogen was diminished in the applications the phosphoric acid and potash were increased to the extent of making the money value of the application uniform in all cases. The general application of nitrogen was given in the form of cotton-seed meal, but in each case 15.6 lbs. of nitrate of soda were applied when the seed was planted. The experiment was made in duplicate. Where cowpea vines had been turned under before planting to cotton the crop practically escaped injury from rust. In a general way, the results of one experiment indicated that the yield increased quite regularly as the supply of nitrogen was diminished. In the duplicate test lack of moisture interfered with the results.

In the second fertilizer experiment potash in the form of muriate was successively diminished and the quantity of acid phosphate and cotton-seed meal correspondingly increased so that in all cases the cost of the fertilizer amounted to $4.17 per acre. In this test the fertilizers were practically without effect.

The weather conditions during the growing season for a series of years are tabulated. Fertilizer formulas for various crops on different kinds of soils are given in an appendix.

Cotton culture, J. S. Newman (*South Carolina Sta. Bul. 75, pp. 13, figs. 3*).—Popular directions are given for the culture of cotton in South Carolina.

Peas and the pea weevil, C. A. Zavitz and W. Lochhead (*Ontario Agr. Col. and Expt. Farm Bul. 126, pp. 32, figs. 9*).—This bulletin contains a summarized account of the cultural work with peas at the Ontario Agricultural College, together with the results of experiments in the control of the pea weevil. The pea weevil is described in detail and a map given showing the present distribution of this insect in Canada. More than 100 varieties of peas have been grown in the experimental grounds at the college during the past 14 years. A table is given showing the character of the vines as regards growth and susceptibility to weevils, yield, etc., of 26 leading varieties for a period of 7 years.

Some varieties of peas, like New Canadian Beauty, are double in size those of other varieties like Common Golden Vine, and hence in seeding it has been found necessary to vary the amount sown from 2 to 3½ bu. per acre. The time of maturity has varied for 26 varieties from 94 to 101 days and the extremes in length of vines from 19 to 52 in. The yields per acre have varied from 23 to 38 bu. The average weight per bushel has been 59.4 lbs. for whole peas. Weevilled peas varied in weight from 38 to 52 lbs., and usually the smaller the peas the greater amount of injury done by weevils. The best yielding varieties for the whole province, averaging upward of 25 bu. per acre, are the Egyptian Mummy, Chancellor, Prussian Blue, and Striped Wisconsin Blue. Other varieties averaging between 24 and 25 bu. per acre are Early Britain, Canadian Beauty, and Canada Cluster. The reports of experimenters show that with but few exceptions there are no pea weevils north and east of a line drawn from Brockville to Midland.

Experiments for a number of years in selecting large and small seed of the same variety resulted in an average yield of 30.3 bu. of grain and 1⅓ tons of straw per acre

for large seed as against 23.9 bu. of grain and 1.1 tons of straw per acre for small seed. Using the split pea seed as it came from the thrasher in comparison with whole seed, the average yields were 10 bu. of grain for the former and 30.7 bu. for the latter. Only about 30 per cent of weevilly peas were found to germinate. In seeding peas at different dates between April 18 and May 23, the average yield for the former date was 21 bu. per acre and for the latter 9 bu. per acre. There has been an average increased yield in 30 experiments of 1.3 bu. per acre from seeding peas in drills rather than broadcasting.

Peas were grown in combination with a number of different crops for both forage and grain. The average results of 6 years' experiments with 11 different mixtures indicated peas and oats in the proportion of 2 bu. of oats to 1 bu. of peas as the best mixture. The best results as to fodder were obtained when the Siberian oats and Prussian Blue peas constituted the mixture. In cooperative experiments with farmers throughout Ontario for a period of 5 years, a mixture of tares and oats has exceeded in yield a mixture of peas and oats by about 600 lbs. of green fodder per acre, and it is therefore recommended that in those portions of the province where the pea weevil is troublesome spring tares be used instead of peas to mix with oats. Where peas and oats are grown together for green fodder in weevil-infested districts it is recommended that the crop be cut when the peas have reached the blossoming stage. As regards the yield of grain of several different mixtures, the best results were obtained from a mixture of oats and barley. Peas have been seeded with oats as a pasture crop for cattle, but without very satisfactory results, the oats being eaten much more readily than the peas. The mixture, however, is believed to be very suitable for either sheep or swine. The value of peas as a green manure for wheat is shown in the average results obtained during the period of 4 years in which wheat grown after peas averaged 36.1 bu. per acre, after rape 30.4 bu. per acre, and after buckwheat 29.6 bu. per acre.

Grass peas have proved perfectly resistant to the weevil in Ontario and have yielded at the rate of about 25.7 bu. of grain and 2.2 tons of straw per acre. One year the yield was slightly over 43 bu. per acre. From the average results of 27 cooperative experiments conducted throughout Ontario in 1901, the Grass pea yielded about $\frac{3}{4}$ bu. per acre less than the Early Britain variety and $\frac{1}{2}$ bu. more than White Wonder variety. The yield of forage has been about the same as that obtained from common tares. The Egyptian or chick-pea (*Cicer arietinum*) has been grown at the station, yielding at the rate of about 35.6 bu. of grain and 1 ton of straw per acre. This grain is slow in reaching maturity and the straw is of poor quality.

Directions are given for destroying the pea weevil by the use of carbon bisulphid and it is recommended that the growing of both field and garden peas be discontinued for at least 2 years in those districts where the weevil is now abundant, and that such crops as Early Yellow soy beans, Grass peas, emmer, mixed grains, etc. be substituted.

Experiments with oats, Aberdeen, 1901–2, J. Wilson and W. M. Findlay (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 183–196, figs. 9*).

Sisal, the Yucatan fiber, E. H. Thompson (*Amer. Inventor, 10 (1901), No. 12, pp. 239–241, figs. 13*).—An account of the culture and the manufacture of fiber from sisal.

Sugar-beet investigations in Illinois, C. G. Hopkins and L. H. Smith (*Illinois Sta. Circ. 62, pp. 6*).—This is a brief report of progress on cooperative experiments with farmers throughout the State and on investigations at the station.

Macaroni wheat in South Dakota, E. C. Chilcott (*South Dakota Sta. Bul. 7, pp. 3–28, pl. 1, figs. 2*).—In addition to reporting experimental results this bulletin describes macaroni wheat and discusses its adaptability to South Dakota and its present and prospective market.

A list of farmers who entered into a cooperative culture and variety test with macaroni wheat is given, together with extracts from reports on the results obtained

by the different parties. At the station in 1901, 12 varieties of macaroni wheat yielded on an average at the rate of 21 bu. 26 lbs. per acre as compared with 10 bu. 33 lbs. for 9 varieties of bread wheats. In 1902 the results in yield were also largely in favor of the macaroni wheats, but the conditions this season did not warrant definite conclusions; the bread wheats being later than macaroni wheats were more subject to rust attacks. In several cases the same variety of macaroni wheat gave widely different results on different plats.

The general conclusions drawn from the results are that macaroni wheats are adapted to South Dakota, produce greater yields than Blue Stem and Fife wheats, and are more drought resistant than bread wheats. The following varieties have given good results: Pellissier, Berdiansk, Kubanka, Arnautka, Gharnovka, Yellow Gharnovka, Taganrog, Argentine, Medeah, Velvet Don, and Black Don.

Wheat and milling, A. Girard and L. Lindet (*Le froment et sa mouture. Paris: Gauthier-Villars, 1903, pp. VII + 355, pls. 6, figs. 82, dgms. 3*).—A comprehensive work treating of the composition, storage, and milling of wheat, as well as the nutritive value of wheat and its milling products and related topics.

HORTICULTURE.

A selected list of vegetables for the garden, F. W. Rane (*New Hampshire Sta. Bul. 99, pp. 25–43, figs. 18*).—As a result of experimentation the author has compiled a list of vegetables for culture in New Hampshire. This list is as follows:

Green-Pod Bush Beans.—Giant Stringless Green-Pod Valentine, Stringless Green-Pod, Early Six Weeks, Dwarf Horticultural. *Bush Wax Beans.*—Wardwell Kidney Wax, Currie Rust-Proof Wax, Market Wax. *Lima Beans.* Bush Lima Beans. *Beets.*—Eclipse, Crosby Egyptian, Arlington Favorite. *Cabbage.*—Early Spring, Winningstadt, Early Summer, Succession, Lupton. *Carrots.*—Danvers Half-Long, Chantenay. *Cauliflower.*—Snowball, Erfurt. *Celery.*—Golden Self-Blanching, Boston Market, Pascal. *Sweet Corn.*—Early Cory, Crosby Early, Potter Excelsior or Squantum. *Cucumbers.*—White Spine. *Eggplant.*—New York Improved Large Purple. *Lettuce.*—Big Boston, New York or Wonderful, Grand Rapids, Crumpled Leaf. *Muskmelon.*—Emerald Gem, Rockyford or Netted Gem, Montreal, Long Yellow. *Watermelon.*—Cole Early, Boss, Black-Eyed Susan. *Onion.*—Yellow Danvers. *Parsnip.*—Hollow Crown. *Early Peas.*—Gradus or Prosperity, Claudit, Nott Excelsior. *Late Peas.*—Telephone, Stratagem. *Peppers.*—Sweet Mountain, Large Bell or Bull Nose, Improved Thick Long Red. *Potatoes.*—Early Rose, Delaware, Green Mountain, Washington. *Pumpkin.*—Small Sugar, Golden Oblong. *Radish.*—Early Scarlet Globe, French Breakfast, Wood Early Frame. *Squash.*—Early Prolific Marrow, Essex Hybrid, Warren, Hubbard. *Tomatoes.*—Earliana, Dwarf Champion, Stone, Beauty. *Turnip.*—Early Milan, Early Snowball, White Egg, Red Top Globe. *Swedes or Ruta-Baga.*—American Purple Top Ruta-Baga.

Cultivation of vegetables, and notes on varieties, G. Coote (*Oregon Sta. Bul. 74, pp. 20*).—Popular directions are given for the culture of onions, peas, string beans, Lima beans, horse or broad beans, vegetable marrows, cauliflower, and broccoli. Notes on the behavior of varieties of these vegetables when grown at the station are included. Lima-bean seed grown at the station gave stronger and more productive plants than seed of the same variety obtained from an Eastern seed firm.

Report of the horticultural division, W. F. Massey (*North Carolina Sta. Rpt. 1902, pp. 18–28*).—This is a brief review of experiments with grapes, tomatoes, lettuce, roses, potatoes, sweet corn, bulbs, and cantaloupes.

Cucumbers under glass, G. E. Stone (*Massachusetts Sta. Bul. 87, pp. 3–29, 42, 43, figs. 9*).—A discussion of the botany of the cucumber seed, types of cucumber houses with estimates as to their relative economy, importance of light in cucumber culture,

and the details of forcing, including varieties, temperature, watering, tran-planting, pruning, pollination of flowers, etc. Relative to houses the author says: "The cheapest and most economical house to build and operate in the production of cucumbers is an even or two-thirds span house of large dimensions, such as is most frequently used by lettuce growers. The construction, heating, and management of a large house are proportionally cheaper than of a small house."

The variety of cucumber chiefly grown is the White Spine or some similar sort, though in many instances a cross between White Spine and the English forcing variety Telegraph is used. Giant Pera sometimes crossed with White Spine does not produce a desirable hybrid. A night temperature of 65° and a day temperature of 85° F. is considered the most desirable, and a higher temperature in sunshiny weather. Transplanted plants have not been found to grow faster or make better plants than plants grown directly in the seed bed. The results secured in experimenting on the effects of various amounts of light show a difference of 10 to 80 per cent in the maturity of cucumber plants caused by exposure to single, double, and triple layers of glass. These experiments and others in which the activity of starch development in the leaves of the plants on sunny days was observed, using first and second quality glass, clean and unclean glass, etc., brought out clearly the much greater carbon dioxid assimilation of the plants with every increase in the amount of light. Shadows caused by heavy frames or adjacent buildings retarded assimilation and gave rise to immature plants. With plants in the greenhouse 24 to 30 in. apart the author believes the 1-shoot system of training preferable to training 2 shoots.

In pruning experiments with White Spine, in which a single leader and several laterals were allowed to grow without pruning, "the average yield of fruit on the main shoot was 18 per cent higher than upon the laterals. The lowest laterals, or those nearest the base of the plant, came next in the production of fruit, and the others or higher laterals followed in uniform succession in fruit production. The fruit matured earlier upon the main shoot than upon the laterals, the lowest laterals more nearly approaching the main shoot in this respect, and the other laterals following in uniform succession. The main shoot showed a gain of 36 per cent in the length of time required to mature its fruit over the first lateral. Of the fruit formed on the laterals, 61 per cent occurred in first axils. The number of internodes between the successive formation of fruit on the plant was in the largest number of cases seven."

Considerable other data along this same line are given with 4 varieties in which the plants were allowed to develop a single leader and as many laterals as appeared, the laterals being pruned at the second leaf, or in case fruit did not set in the first axil of the lateral they were pruned just beyond the axil where it did set. In the latter experiments 93 per cent more pistillate flowers were found on the laterals than on the leader.

"Cutting the leader of the main shoot or pruning the laterals caused an increase in the number of laterals. Where laterals are not cut, they are not formed as a rule in the axil of every leaf. Pruning causes a larger amount of fruit to set in the first axils of the laterals, as it was found that in the experiment where pruning was practiced 91 per cent of the axils produced fruit, against 55 per cent where no pruning took place. In some instances where the leader was nipped on unpruned plants this resulted in causing a slight increase in the amount of fruit in the first axil of the laterals. In conclusion it may be stated that from our experience the advantages of pruning seem to be an increase in the yield of fruit, and a concentration of fruit on the plant."

Notes are given on the lack of color in cucumbers, productiveness, and the vitality of cucumber seeds.

The origin of various varieties of American muskmelons, F. W. Rane (*New*

Hampshire Sta. Bul. 96, pp. 125–133).—The author has made a study of the origin and history of all of the well-known varieties of American muskmelons. A table showing the origin, introducer, and year of introduction of 54 varieties is given in the bulletin, together with a number of letters from various seed firms giving data and notes along the same lines. It was believed when the experiment was undertaken that a large number of American muskmelons would be found to be of definite origin. This belief was not substantiated. Very few varieties of known parentage were found. For the most part the varieties are chance seedlings or strains of well-known kinds.

From the notes obtained from seed firms it appears that the Green-fleshed Osage muskmelon came from a variety called Grand View, which in turn was an impure strain of Emerald Gem. Long Island Beauty is a variety of the Hackensack type originated on Long Island. Miller Cream was originated by John D. Miller, of Elmira, N. Y., in 1878, and is believed to have been a cross between Sill Hybrid and Cassava. Osage is believed to be an improved selection from Miller Cream. Osage Gem was a cross between Osage and Netted Gem. Paul Rose is a selected form of Osage. The winter muskmelons Eden, Khiva, and N. E. Hansen have been brought to prominence chiefly through the influence of J. F. Brown, of Utah. Ideal was originated by Professor Price of the Texas Agricultural College and Station.

Onion growing in the Cache la Poudre Valley, W. Paddock (*Colorado Sta. Bul. 81, pp. 10, figs. 3*).—A popular discussion of the onion-growing industry in the Cache la Poudre Valley, dealing with soils, preparation of land, fertilizing, seeding, cultivation, irrigation, harvesting, markets, varieties, etc. Yellow Globe Danvers is practically the only variety grown. Sowing the seed in the seed bed and transplanting to the open field has not been found profitable in that section. The cost of growing the crop is estimated to be from $50 to $90 per acre, averaging probably about $60 per acre. The prices received vary from 65 to 75 cts. per 100 lbs. in the fall.

The tomato industry of the Arkansas Valley, H. H. Griffin (*Colorado Sta. Bul. 78, pp. 20*).—This bulletin records the results of 3 years' experiments and observations with tomatoes in the Arkansas Valley, and gives suggestions on the culture of tomatoes, including irrigation, the control of pests, diseases, etc. At present 5 canning factories are located in the valley. These are not always fully supplied with tomatoes. Factors tending to lower yields in the valley are strong winds, aridity, dashing rains, and too late planting or planting on impoverished soil. As the result of experiments in 1900 it was decided that pruning the plants in field culture was not advisable. Plants started in the hotbed and transplanted to the field produced fruit earlier and gave a greater total yield than plants grown from seed sown in the field. The variety Perfection ripened fruit about 3 weeks earlier than Stone, and yielded heavier. Hail interfered with the station experiments of 1901. Observations in the neighborhood that year showed that the heaviest yields were obtained from plants set early in May rather than later. On one farm the crop on land manured with 9 loads of sheep manure per acre ripened fruit about 3 weeks earlier than where no manure was used. Strong, stocky plants grown at the station produced larger and earlier crops than plants that had not been transplanted before setting in the field, or plants grown from seed sown in the field. The author found that it required about 40 to 45 days after setting for the fruit to ripen.

The best results in tomato growing were found on virgin sandy soils. Much adobe is not desirable. Transplanting tomato plants is of no advantage unless done early enough to permit of an increase of the root system. A good stocky plant should be 6 to 8 in. high and about as thick as a lead pencil when set in the field. On well fertilized land plants should be set 4 ft. apart each way. In irrigation the greatest quantity of water should be applied when the fruit is growing. Too much water early in the growth of the crop produces a tender growth of yellowish color. Irrigation late in the season after the nights have become cold may retard ripening.

In a test of 17 varieties of tomatoes Beauty was the most satisfactory for canning purposes. It is an early variety, of good appearance and quality, and one of the most productive varieties grown. It also stands shipping well. Acme is a somewhat earlier variety and may be preferred for early shipment. Fordhook First is also considered a good early variety.

Fertilizers for market-garden crops, B. DYER (*Jour. Bd. Agr. [London]*, *9 (1903), No. 4, pp. 461–481*).—This work has been noted from another source (E. S. R., 14, p. 961).

Experiments in orchard culture, R. A. EMERSON (*Nebraska Sta. Bul. 79, pp. 33, figs. 12*).—This bulletin reports the results of (1) tests of various methods of orchard culture to determine the effects of each method on soil moisture and the growth of young orchard trees, (2) tests of cover crops to determine their effects on fall development and winter injury of young peach trees, and (3) tests of soil covers and of various amounts of soil moisture on the root killing of apple and cherry stocks.

In the first instance a young orchard set in the spring of 1901 was divided into 8 plats, each plat containing 30 apple, 12 cherry, 10 peach, 10 pear, and 14 plum trees. One plat was cropped with watermelons and kept cultivated throughout the season, another with pole beans, and one with corn. One plat was given clean cultivation throughout the two seasons of 1901 and 1902. Another was cropped with oats both seasons. Three plats were given clean cultivation during the early part of both seasons and then seeded, one to millet, one to oats, and weeds allowed to grow on the third. In addition to the above plats, a ninth smaller plat on which no trees were grown was seeded to rye to note the effect on soil moisture. During the season for the 4 months from May to August, inclusive, only a little over 7 in. of rain fell in 1901, while during the same period in 1902 28 in. fell.

In these experiments rye, during the first season, dried the ground most of all the different methods of cultivation. This plat became dry earlier and remained dry nearly a month longer than any other plat. Next to rye the oat crop dried the ground most seriously, though not to a much greater degree than did corn and cover crops. The oat plat became dry, however, about 2 weeks earlier in the season and the drought lasted much longer than on the corn plat. The soil in the cover-crop plats did not become dry for a week or two after the corn ground did. Clean cultivation dried the soil the least of any of the different methods of culture, while vegetables dried the soil but little more than clean cultivation. There was from two to three times as much moisture available to plants during the dry season in the clean cultivated plat as in the oat plat. Both the oat and cover-crop plats absorbed more moisture during heavy rains than the clean cultivated plat, but this was counterbalanced by the more rapid loss during periods of dry weather.

The effect of drought on the young orchard was especially noticeable on the oat plat, where more than 50 per cent of the trees died. On the other plats the loss varied from 2 trees on the clean cultivated plat to 5 where vegetables were grown, 7 on the corn plat, and 9 where cover crops were used, out of a total in each case of 76 trees set. Tables are given showing the average height and breadth of the top and diameter of the trunks of trees on the different plats.

In summarizing the results of these tables the author states that all things considered—drought killing, height of tree, breadth of top, and diameter of trunk—"the vegetable and clean cultivation plats rank first, the former being slightly ahead of the latter. The next in rank are the cover crop and corn plats, the former being very slightly ahead of the latter. The oats plat naturally ranks lowest, much lower than the corn and cover crop plats."

The serious drying effect of rye is noted in one other case where rye was seeded in a bearing orchard. During the summer of the drought only a few trees died, but the following season the spring was very dry, and although abundant rains came in

June all the trees in this orchard died of drought during one of the wettest seasons on record in Nebraska.

In the study of the effect of cover crops on fall development and winter injury of young peach trees, 2 orchards of 48 trees each were set, one orchard on bottom land and the other on upland. Both orchards were given clean cultivation up to about the middle of July each year, then each orchard was divided and one-third seeded to oats, one-third to millet, and the remaining third given clean cultivation throughout the fall. In 1901 all the trees on the upland stopped growth early in the fall and no great difference was noticeable in the maturity of the wood of the trees in the different plats. On the bottom lands the trees on the cover crop plats stopped growing about the middle of August, but growth was continued on the cultivated plat until much later. The following spring it was found that many of the trees on the bottom lands had been badly injured, half the trees on the late cultivated plats being dead and the remainder seriously injured. On the cover-crop plats about half the trees were badly injured, while the remainder were unhurt. Not a single tree was dead. About $\frac{1}{3}$ more trees were injured where oats were seeded than where millet had been used. None of the trees on the uplands was seriously injured by the winter's cold, though on the late cultivated plat nearly all the trees showed considerable brown coloration beneath the bark. The results secured in 1902 are not yet complete. They show, however, a better ripening of the wood on the cover-crop plats than on the cultivated plats.

In the third experiment 7 boxes, each 2 ft. square and 18 in. deep, were filled with loam soil of varied water content. In each box 25 apple and 10 cherry seedlings were planted. Six of the boxes were set outdoors about the middle of December. Hay was placed between and around the boxes and covered with soil. One box of trees was stored in a cool, dry cave. Of those left outdoors one box was covered with a mulch of straw 4 in. deep, one was protected with a covering of snow about 4 in. deep whenever snow fell, and the remaining boxes were left without any covering, snow being swept off when it came. The following February, when the boxes were examined, none of the cherry roots had been injured enough to prevent their growing, and there was practically no difference in the degree of injury in the different boxes. The apple roots, however, were considerably injured, the greatest injury occurring in the drier soils.

Out of 25 apple trees set in the unprotected box containing 10.4 per cent of moisture, 20 trees were dead and 5 injured. In the unprotected box containing 15.2 per cent of moisture, 19 trees were dead and 6 injured. In the box with a moisture content of 19.8 per cent, 3 were dead, 10 injured, and 12 uninjured. In an unprotected box containing 25.6 per cent of soil moisture, 8 trees were dead, 4 injured, and 13 uninjured. The box covered with the straw mulch contained 16 per cent of soil moisture, and none of the trees were dead in this box and but 7 injured. In the box covered occasionally with snow, and containing 15.8 per cent of moisture, 7 were dead and 8 injured. Not a tree was injured in the box stored in a cool, dry cave, though it contained but 10 per cent of soil moisture. This is believed to show that the winter injury to apple roots is not alone due to dryness of the soil, but to cold and dryness combined. The mulch was advantageous in preventing the alternate freezing and thawing which took place in bare soils. A record is given showing the depth of frost in bare ground and ground covered with a millet cover crop.

In conclusion, the author states that a cover crop is one of the best means for protecting the roots of trees from winter injury. Likewise any method of culture that leaves the ground moist in fall has an advantage over methods that leave the ground dry. In the station experiments the soil under cover crops that have been killed by early frosts has been as moist on the approach of winter as soils given clean cultivation throughout the fall. For the young orchard, thorough cultivation in early summer, followed by a cover crop in the fall, is advocated.

"Good cultivation in early summer can often be given young trees by growi some cultivated crop in the orchard. Tender crops are best, since they can not b sown so early as to dry the ground seriously in spring, and are killed by fall frost thus preventing very late drying. Cropping with corn, for instance, insures fair thorough early cultivation, and corn is a fair substitute for a cover crop in fall a winter."

A study of Northwestern apples, N. E. HANSEN (*South Dakota Sta. Bul. 7 pp. 143, figs. 84*).—This bulletin discusses methods of propagating apples and of ori nating new varieties, best varieties of orchard and small fruits for planting in t Northwest, and the terms used in describing apples; and gives descriptions of mo than 300 varieties of apples, including notes on their origin. A key or system classification is proposed by means of which the names of unknown varieties apples may be determined. The necessity of very hardy varieties of apples for t Northwest is discussed in some detail by the author, and the standing offer of t Minnesota State Horticultural Society of $1,000 to the originator of a variety of app that shall be as hardy as the Duchess, equal in quality, size, and appearance Wealthy, and possess the keeping quality of Malinda, is noted. As a stock for appl the station has found the Siberian crab (*Pyrus baccata*) perfectly hardy. The Ru sian Apple Nomenclature Commission, appointed in 1898 by interested societies Minnesota, Iowa, Wisconsin, and South Dakota, of which the author was secretar defined and described 14 groups of apples, strongly favoring Duchess, Hibernal, Cha lamoff, Anisim, Yellow Sweet, Repka Malenka, Longfield, Cross, and Christmas the best for the average planter. Since then a number of seedlings have arisen the different States, but it will require a "test" winter such as that of 1884–85 befo their hardiness can be fully determined.

In growing apples from seed the author has found that seeds obtained from cid mills should be separated from the pomace before planting, since the fermenti pomace contains an acid injurious to their germination. Clean seed washed fr the pomace within 24 hours after pressing should be spread out to dry for a day two, then mixed with moistened sand and buried in small boxes with holes in t bottom for drainage in well-drained spots in the garden over winter. The auth has been most successful at the station in planting the seeds in beds 4 feet wide s rounded by boards a foot high and given half shade by means of a lath screen as so as the seedlings appear above the ground. Fall planting 1 in. deep in rows in. apart and heavily mulching over winter with coarse rotten manure is preferr In discussing the reproduction of varieties the author quotes G. P. Peffer, origina of the Pewaukee, Peffer, and other varieties of apples, as holding that any apple v reproduce itself from seed if inbred by covering the blossoms to prevent access pollen from other varieties.

South Dakota is divided by the author into 12 districts, and varieties of appl plums, cherries, native fruits, raspberries, blackberries, currants, gooseberries, stra berries, and grapes are recommended for each section.

Propagation of plums, third report, F. A. WAUGH (*Vermont Sta. Rpt. 1902, 249–260, figs. 5*).—The work here reported is in continuation of that of the two prec ing years (E. S. R., 14, p. 43). The nursery work in 1900 consisted in propagatin different varieties of plums, each representative of a class, on 5 different stoc The varieties used were Stoddard, Bavay, Chabot, Milton, and Newman, a the stocks Americana, Miner, Marianna, Peach, and Sand Cherry. Each variety v grafted on each stock, thus making 25 different lots. There were 60 grafts made each lot. One-half of the grafts in each lot were planted in Vermont and the ot half in Maryland. The grafts at the Vermont Station practically failed. This re taken in connection with other work indicates that nursery stock can not be profita produced in Vermont. All the grafts produced a satisfactory growth in Maryl except Bavay, which was wholly unsatisfactory. Data on the growth of the tops

roots of the other varieties are recorded in detail. In general, trees on Miner roots were poor, while those on Peach and Sand Cherry were especially good. Milton and Newman showed the largest number of live trees on the different stocks and Chabot the least. The striking feature of the experiment was the excellent results obtained on Sand Cherry stock (*Prunus pumila besseyi*).

The root systems of the different stocks are illustrated and described, and the orchard characters of the trees noted. In the author's opinion too much stress has usually been laid on the value of fibrous roots in transplanting trees. Freshness and vigor should constitute the chief desiderata in the roots of the nursery tree. The root system of trees on Americana stocks was rather small, but vigorous and hardy, and the union with most plums, especially Americana varieties, was excellent. The root system of trees on Miner stocks was weak in every respect. There were no tap or fibrous roots, and the lateral branches were scattering and irregular. The best root system on the whole was found on Marianna stocks, while the union of this stock with most varieties was excellent. Fairly good root systems were produced on Peach stocks, but the union was generally poor. The Sand Cherry stocks, while used at the station for only a year, have given remarkably fine root systems.

A summary is given of the experiments made during the past 3 years with different stocks and varieties, from which it appears that Chabot makes a comparatively slow growth and nearly always gives a lower percentage of trees than any other variety. Americana roots make good unions and give comparatively stout, stocky trees which, however, are measurably dwarfed. Marianna stocks have generally given long, tall, sound trees but a low percentage of successful grafts, averaging but 32 as against 46 Americana and 44 Peach. Attention is called to the fact, however, that these results are averages and that actual quality and vigor of the stock often exert a greater influence than its botanical name.

A review of Americana plums, F. A. Waugh (*Vermont Sta. Rpt. 1902, pp. 260–265, pls. 4*).—Of the different groups of American plums, *Prunus americana* is considered by far the most important. The various types of American plums are briefly reviewed and their botanical names given, with the principal synonymy. At the present time there are about 200 named varieties of American plums. Many of these, however, are indistinguishable from each other. Lists are given containing the names of varieties of (1) proved value, (2) those of doubtful value requiring further test, and (3) culls or varieties which should be discarded.

The Japanese hybrid groups of plums, F. A. Waugh (*Vermont Sta. Rpt. 1902, pp. 265–267*).—In a previous report (E. S. R., 14, p. 44) the Gonzales group of hybrid plums containing Japanese blood was classified and named botanically. In the present report hybrids of the Japanese with the Americana and Simon plums are discussed. Hybrids between the Japanese and the Americana plums are classified as the Omaha group, using the variety of that name as the type of the group. The group is described and given the botanical name of *Prunus triflora rustica*. Hybrids of Japanese and Simon plums (*P. simonii*) are classified as the Wickson group and given the new name of *P. triflora recta*. In this group the variety Wickson is especially typical as regards fruit, and Bartlett as regards tree and foliage.

A résumé of what I know about my specialty—plums, J. W. Kerr (*Trans. Peninsula Hort. Soc., 16 (1903), pp. 41–44*).—The author states that wherever the peach is entirely hardy it is a very satisfactory stock for plums and that root grafting is incomparably superior to budding in propagating on this stock. The varieties Abundance and Chabot are considered the best of the Japanese or hybrid plums. Milton and Whitaker are considered the best among native plums. The author states that there is more profit in an acre of Milton plums than of any other variety.

Laying down of peach trees, W. Paddock (*Colorado Sta. Bul. 80, pp. 8, figs. 4*).—In many sections of Colorado peaches are destroyed 4 years out of 5 by late spring frosts. The methods of laying the trees down over winter and covering as a

protection are described. The practice of laying down is begun on trees the first years they are set in the orchard. Some time in November after the leaves have fallen a circle of earth about 4 ft. in diameter is removed from around the tree. Water is then poured in and the tree worked back and forth until the roots are loosened and the tree bent to the ground in the direction of least resistance. The branches are then tied together and the tree covered with burlap held in place with earth. A light layer of earth is then thrown over the tree. As the blossom buds begin to open the following spring the covering is loosened to admit of light and air. The blossoms are exposed to the sun gradually and after all danger from frost is considered over they are raised to an upright position and held in place by a couple of props. In placing the trees in the upright position the ground is again watered and when wet enough the trees are raised without difficulty. Old trees can not be very successfully handled in this manner. The practice must be begun with the young trees and continued. It is stated that the process seems to be in no way detrimental to the health of the trees since they live as long and bear as much fruit according to the size of the top as those grown in peach sections. The author believes that by laying down the trees in winter according to the plan outlined, peaches may be grown in nearly all parts of Colorado.

A remarkable pineapple (*Queensland Agr. Jour., 12 (1903), No. 4, p. 254*).—A curious pineapple having the characteristics of the smooth-leafed Queen and the ordinary rough-leafed pine is described. The fruit is described as being full of seeds, the juice very abundant but of poor flavor.

A remarkable mango (*Queensland Agr. Jour., 12 (1903), No. 4, p. 254, pl. 1*).—A mango fruit having a kind of horned protuberance is described. The fruit is borne on a tree between 4 and 5 years old and yields quite abundantly. The description is accompanied by a full-page illustration of the fruit.

Report of central station at Ames, H. C. Price (*Trans. Iowa Hort. Soc., 37 (1902), pp. 219–221*).—Notes on the crosses made between varieties of apples, plums, and cherries, and on the distribution of orchard pollen among fruit growers. An experiment in stratifying whole fruits in sand out doors, stratifying the core of the apple containing the seed, and stratifying the seed after they have been removed from the apple resulted in favor of removing seeds entirely from the pulp before stratifying.

An Iowa plant breeder; some of his creations, H. C. Price (*Rural New Yorker, 62 (1903), No. 2776, pp. 277–279, figs. 3*).—An account, with illustrations and descriptions, is given of the varieties of crab apples, grapes, and dewberries originated by Newton K. Fluke in Iowa.

The influence of stock on scion, Leclerc du Sablon (*Compt. Rend. Acad. Sci. Paris, 136 (1903), No. 10, pp. 623, 624*).—A pear grafted on a quince produces larger fruit and yields more abundantly than when grafted on pear seedlings. The author studied one of the causes of this phenomenon. He found that the reserve material accumulated during the autumn and winter in the trunk and limbs was considerably greater in the pear grafted on the quince than in trees grafted on pear seedlings. In the spring, therefore, when growth starts, the trees grafted on quince are better able to contribute to the formation of fruit a large quantity of food than trees grafted on pear seedlings. No cause could be assigned as to why more starch should accumulate in the trees grafted on quince than in the trees grafted on pear seedlings.

Hardiness of some grafted stocks, J. M. Guillon (*Rev. Vit., 19 (1903), No. 487, pp. 301–305, figs. 5*).—An account of the growth of several species of grafted stocks in shallow and deep soils.

Comparative structure of calluses in grafted plants, L. Daniel (*Rev. Vit., 19 (1903), No. 482, pp. 324, 325*).—A microscopical study of the calluses of a large number of grafted plants.

Grafting nutmegs (*Agr. News [Barbados], 1 (1902), No. 6, p. 84*).—Detailed directions are given for grafting nutmegs.

The white blackberry "Iceberg" (*Sci. Amer., 88 (1903), No. 19, p. 358, fig. 1*).—An account of the origination by Luther Burbank of a white blackberry. The fruit is white and of good quality, being as firm when ripe as Lawton. The plant is said to be very productive.

Unfruitful currants, EWERT (*Gartenflora, 52 (1903), No. 8, pp. 210–218, figs. 6*).—The author made an investigation of certain varieties of currants that flowered profusely but failed to produce fruits. The flowers were first examined as to the amount of nectar they might contain, when it was found that the amount of dextrose in flowers of unfruitful sorts was practically equal to that in fruitful varieties. The pollen of the unfruitful sorts was found to germinate in a 3 per cent sugar solution containing 1½ per cent of gelatin. The pistils of a large number of varieties were then examined and it was found that while the pistils of the unfruitful currants were practically as long as any of a number of other varieties, the width was very much less. Drawings are given showing the difference in the appearance of the stigmas of sterile and fruitful currants, and the opinion is expressed that the sterility in the case under observation was largely due to some malformation of the pistils.

Grafts in moss, R. C. DE BRIAILLES (*Prog. Agr. et Vit. (Éd. L'Est), 24 (1903), Nos. 10, pp. 308–310; 11, pp. 326–333, figs. 4*).—An account of the handling of grape bench grafts. As soon as the grafts are made they are placed in boxes containing a layer of moistened moss and charcoal mixed in the proportion of 1 of charcoal to 3 of moss. A layer of this mixture about 10 cm. deep is placed in the bottom of the box. The grafts are then put in and surrounded with a layer of the mixture about 5 cm. thick. The top of the grafts are covered over with cut moss and charcoal 6 to 8 cm. deep. Boxes of grafts thus prepared when covered are ready for shipment. In the future care of these grafts the boxes are placed in warm rooms having a temperature of 30 to 35°. Within about 24 hours thereafter the buds begin to swell; in 4 or 5 days they lengthen rapidly, and within 8 days have a length of several centimeters. At this time the layer of moss over the grafts is removed completely and the condition of the growing buds noted. If all is going well a layer of recently prepared chopped moss and charcoal about 2 cm. deep is replaced over them. If any appear to be rotting these are left exposed for about 24 hours and then covered. If transpiration is taking place too rapidly in some portions of the box a thicker layer of moistened moss and charcoal is placed over them. The plants are watered by placing the boxes in a tank so that the water rises through holes in the bottom nearly up to the callus. The water should have the same temperature as the room. No water is applied above, since it is likely to cause mildew and rotting. Watering from below is practiced about every 8 days. Within 15 to 20 days the grafts will have become well calloused and a considerable leaf growth have appeared. The plants may be then hardened off as rapidly as desired and transplanted to the field.

Some of the advantages of growing grafts in moss rather than out of doors are as follows: The work of grafting is simplified, the grafts being put in boxes as soon as made and no tying required; a degree of vegetation is attained in 20 days that in outdoor practice would require about 2 months; a more perfect callus and union is obtained; disbudding of the stock is unnecessary.

Grape pollen and pollination, F. H. HALL, S. A. BEACH, and N. O. BOOTH (*New York State Sta. Buls. 223 and 224, popular ed., pp. 8, pls. 2*).—This is a popular edition of these bulletins (E. S. R., 14, pp. 869, 870).

The use of plaster in viticulture: Its application in connection with manures, L. GRANDEAU (*Jour. Agr. Prat., n. ser., 5 (1903), No. 14, pp. 432–434*).—Experiments extending over a number of years are reported. These showed that applications of gypsum alone or in connection with barnyard manure largely increased the yield of grapes.

Direct shipments of grapes from Spain, A. E. CARLETON (*U. S. Consular Rpts., 72 (1903), No. 272, pp. 81, 82*).—Notes on the shipment of fresh grapes from Spain to the United States and possibilities of the further development of this trade.

Fertilizing by means of leguminous plants applied to tea culture. A. E. KERKHOVEN (*Teysmannia, 13 (1902), No. 1, pp. 15–21*).—The experiments first undertaken in 1899 have not been definitely completed, but the author gives the results of work done up to January, 1902. Small tea plantations were fertilized with various commercial fertilizers, with stable manure, and by planting with a native leguminous tree called "dadap." The results so far obtained indicate that the first effect of the planting of "dadap" in the tea plantations is injurious because of the shade, but that the subsequent influence is more beneficial than the heaviest application of stable manure. This is due to the nitrogen stored in the root nodules.

Experiments were also made to learn how the leguminous shade tree should be treated to minimize the injurious effects of the shade and at the same time to retain the advantages of the nitrogen-gathering properties of the tree. The best practice appears to be to prune the tree heavily, so as to reduce the shading and also to encourage the tree to renewed growth and thus extend the root system.

Observations were also made on the influence of leguminous shade trees on plantations of cinchona and Ledgeriana trees, and it was noted that when the plantations were shaded with Albizzia they remained in good health for a longer time than when not so shaded. The stems, though more slender, were longer and yielded more bark under shade than without it.—H. M. PIETERS.

Fruit storage experiments (*Illinois Sta. Circ. 67, pp. 3–10, 21–23, fig. 1*).—A report of progress is given on the cold-storage work with apples which is being carried on in Illinois under the direction of the station. An account of the construction of a cold-storage house, capable of holding 2,500 bbls. of fruit and of storing apples in cellars insulated for the purpose, has been previously noted (E. S. R., 14, p. 356). During the season of 1901–2, 2,000 bbls. of fruit were placed in the cold-storage house October 5 and 70 tons of ice put in the refrigerator. The temperature of the storage room fell rapidly after the ice was put in to about 33° F., and this temperature, or a little lower, was maintained throughout the experiment. The cost of storage per barrel of fruit up to April 23 (about 7 months) was 19.1 cts., or 30.9 cts. less than the usual charge for apple storage. Based upon these results it is estimated that the building if stored to its full capacity each year would pay for itself in 5 years.

The fruit in the building was examined from time to time during storage. Without exception the fruit kept well. "There was no scald, no withering. The fruit remained plump and in perfect condition, and the percentage of rotten fruits was very small." The results are believed to plainly show the utility of buildings of this character cooled by ice. "Commercial growers of apples can well afford to invest in similar houses and thus add greatly to their profits." The experiences in cellar storage in southern Illinois show pretty clearly that horticulturists can not afford to insulate a cellar for storing fruit. The earth is too good a conductor of both heat and cold. Fruit stored in these cellars was more or less wilted and the percentage of rot was quite high.

Experiments were made with Ben Davis and Winesap apples in storing at temperatures of 31, 33, 35, and 37° F. The Ben Davis variety kept better and scalded less at 31° than at any other temperature. The difference was not so striking with the Winesap variety, but was in favor of the lower temperatures.

Another problem investigated was the degree of maturity most suitable for picking apples to be held in cold storage. The results obtained indicate a great superiority in the keeping qualities of mature over immature fruit. The mature fruit in storage showed a much smaller percentage of rot, was less subject to scald, did not shrink as much, had better color, and better selling qualities when removed from storage.

Notes are given on an experiment in orchard drainage and fertilization under way and of the growing of a number of different cover crops in the orchard.

Cold storage, H. T. GALPIN (*Jour. Soc. Chem. Ind., 22 (1903), No. 6, pp. 346–348*).—A technical account of the use of different brines for producing cold and

the various problems involved in cold storage. Calcium chlorid is believed to be a much better solution for producing cold than common salt, and it has the further advantage of not freezing at even 50° below zero. A 30 per cent solution will freeze at about 54° below zero. For ice making, where a brine temperature of 10 to 20° F. is carried in a tank, a brine ranging from 12 to 18 per cent is all that is required.

Some remarks on the canning industry, and details of processing fruits and vegetables, W. B. Alwood (*Virginia State Hort. Soc. Rpt. 1902, pp. 202–216*).—A discussion of the importance of the canning industry, buildings and equipment, contracting for growth and delivery of crops, principles underlying the processing of canned goods, germs which cause fermentation and putrefaction, critical temperatures, and crops commonly canned in Virginia.

Report of the Nova Scotia School of Horticulture, F. C. Sears (*Rpt. Sec. Agr., Nova Scotia, 1902, pt. 1, pp. 70–90, figs. 8*).—A brief report is given of the work of the school during the year, with lists of orchard fruits and of the principal trees and shrubs, including climbers, roses, etc., planted at the school, and an account of various experiments in orchard culture and the treatment of apple canker. Crimson clover and tares have been found very effective orchard cover crops, as well as alfalfa. Twelve model orchards have been established in as many different counties in the province during the year. In 5 of these orchards experiments were made in cutting back the fruit trees at the time of setting in the orchard. Five trees in each orchard were pruned in the usual way and 5 allowed to grow without pruning. The results for the season were generally in favor of cutting back the limbs at the time of setting in the orchard. Some data are given showing the number of trees of different varieties of apples affected by canker, from which it appears that Ribston Pippin, Nonpareil, and King of Tompkins are specially subject to this disease.

The American carnation; how to grow it, C. W. Ward (*New York: A. T. De La Mare Printing and Pub. Co., Ltd., 1903, pp. 296, pls. 5, figs. 94*).—This is a comprehensive work on the culture of carnations in America. Various chapters deal with the origin and early history of the carnation, soils, fertilizers, greenhouse and field culture, diseases and insect pests, greenhouse heating and management, raising carnations from seed, cross breeding, etc. Sketches are given of methods of carnation culture in different sections of the country, with brief biographical sketches of 10 prominent carnation growers in those sections.

Breeding hybrid carnations, C. W. Ward (*Proc. New Jersey State Hort. Soc., 28 (1903), pp. 227–233*).—The author secured better results by breeding between varieties originating from a common source than between varieties of widely different origin. Working along this line, colors were definitely fixed and finally bred upon plants of definite habits of growth and freedom of bloom. The first colors fixed in the author's work were of the crimson varieties General Gomez, General Maceo, Governor Roosevelt, President Roosevelt, Octaroon, Creole Beauty, etc. For the purpose of systematic work, carnations were divided by the author into 10 different groups based on color. The crimson section has been so well fixed that good varieties can be produced from seed. Experimental crossing in the pink and white sections has resulted in fixing these sections fairly well, but attempts to fix the yellow and white variegated type, as well as the fancy and purple and blue sections, have not been very successful. The greater number of plants grown from cross-fertilized seed contain the dominant characteristics of both parents. In many instances 90 to 95 per cent of the seedlings held to the dominant color, and in some cases even 100 per cent held true to the color of both parents.

So far as the author has been able to judge "the pollen parent, apparently, has no positive determinating influence upon the color, the color of the seed parent prevailing fully as much in the progeny as that of the pollen parent. But where the desired color predominates in several generations of the ancestry of both parents it is comparatively easy to reproduce it. The seed plant also apparently has no positive determinating influence upon the habit."

In breeding carnations the continuation of a series of experiments was frequently interrupted by the production of plants producing neither pollen nor seed. Again, other plants might produce seed but no pollen, and vice versa.

The chief advancement in carnation culture during the past 70 years, in the author's opinion, has been in the improvement of cultural methods, and the growing of improved hybrids and varieties which do not burst the calyx in growing.

The fertilization of chrysanthemum flowers (*Rev. Hort. [Paris], 75 (1903), No. 9, p. 195*).—It is stated that chrysanthemum flowers with small heads will yield a larger quantity of seed than flowers with large heads. In hybridizing chrysanthemums it is believed that better results will be obtained if the plant employed as a mother has both large and small heads. Pollen should be taken from plants grown naturally, that is, not pruned or disbudded.

Soil for blue hydrangeas, E. André (*Rev. Hort. [Paris], 75 (1903), No. 5, pp. 55–57*).—Hydrangeas sometimes produce red and sometimes blue flowers. The reasons for this have not been definitely known. The author states that the soil coming from near Angiers and composed of granite, schist, sand, and considerable quantities of iron, and covered with a thick turf formed of decomposed vegetable matter, always produces blue hydrangeas. This soil is sold to horticulturists in different parts of France as a blue hydrangea soil. If, however, the roots of hydrangeas potted in this soil are permitted to permeate ordinary soil the flowers produced are likely to be of a red or dirty violet color. The author analyzed this soil, obtaining the following results:

Analyses of soil used for growing blue hydrangeas.

Physical analysis.	Per cent.	Chemical analysis.	Per cent
Pebbly	24.00	Nitrogen	0.410
Black silicious	61.80	Phosphoric acid	.116
Clay	2.16	Lime	.050
Calcareous	.09	Magnesia	.200
Organic matter	7.55	Potash	.085
Humus	.91	Soda	.004
Water	3.49	Iron oxid	3.470
		Sulphuric acid	.085
	100.00		

It is seen that this soil is essentially silicious, very rich in organic matter and in humus, quite poor in nitrogen and phosphoric acid, and excessively poor in lime and potash. This analysis is believed to demonstrate that the presence of iron in the soil is not the only unique factor in the production of blue hydrangeas, but that there should be in addition an exclusion of lime. With the knowledge of the composition of soil in which blue hydrangeas flourish, it is now believed that it will be possible to synthetically produce a soil that will grow blue hydrangeas.

Blue hydrangeas (*Rev. Hort. [Paris], 75 (1903), No. 5, pp. 114, 115*).—Observations are given which show that when débris from a slate roof was mixed with the soil, the color of the hydrangeas grown in such soil was blue. Where the broken slate was absent the color was red.

Nicotiana hybrids of the second generation, G. Bellair (*Rev. Hort. [Paris], 75 (1903), No. 3, pp. 54, 55, figs. 4*).—The author pollenized *Nicotiana sylvestris* by *N. tabacum* in 1901. The hybrids obtained were all similar in character. Seed obtained from these plants was planted in 1902. The resulting crop varied greatly resembling neither the original parents nor the hybrids of the first generation. Four distinctive types obtained are described. One type resembled *N. virginica*, two were profusely flowering sorts, and the fourth type was noticeable on account of the color and unusual proportions of the flowers.

Etherization and chloroforming of dormant plant parts, W. Johannsen (*Norsk Havetidende, 18 (1902), No. 12, pp. 194–203, figs. 5*).—The method of etherizing

tion and chloroforming of dormant plants worked out by the author for the purpose of shortening the resting period and thus accelerating the forcing of plants, flowers, bulbs, etc., is described in outline in the paper. The plants are placed in an air-tight etherization chamber lined with tin foil or with soldered sheet zinc; a layer of 2 to 3 cm. of dry sand is placed at the bottom of the chamber; when this has been carefully closed ether is poured in through a funnel at the top of the box and caught in a dish suspended directly under the same. The most convenient temperature for conducting the etherization is 17 to 19° C. The higher the temperature the more violent is the action of the ether. The ether vapor is generally left to act on the plants for 48 hours; toward the end of the rest period 24 to 30 hours will be found sufficient. As to quantities of ether required, 30 to 45 gm. of ordinary sulphuric ether per hectoliter (26.4 gal.) of air space is used in case of different plants, viz, lilacs, 32 to 40 gm.; Marie Legraye, not to exceed 38 gr.; Viburnum, 38 to 40 gm.; *Prunus triloba*, *Amygdalus persica*, Spiræa, etc., 30 to 35 gm.; *Azalea mollis* and other deciduous plants, 30 to 35 gm.; *Pyrus "floribunda"* forms, Staphylea, Deutzia, and Magnolia, 35 to 40 gm.; lily of the valley (before planting), 30 to 35 gm. After the etherization the plants are preferably forced at once; it is not necessary to use as high temperatures for etherized plants as is ordinarily the case. As the flowers of etherized plants are apt to be of a paler color than those appearing later in not etherized plants, it is advisable to place the plants, after the buds have opened, at a temperature of 12 to 15° C., where a deep color is a desideratum.

Chloroform may be used in the place of ether for shortening the resting period of plants, but it acts much more intensely and must be used in smaller quantities; three-tenths of the quantities recommended with ether will suffice. The highly inflammable character of both ether and chloroform renders extra care necessary in handling the liquids, especially where the etherization method is used under commercial conditions.—F. W. WOLL.

A woman's hardy garden, HELENA R. ELY (*New York: The Macmillan Co., 1903, pp. XVI+215, pls. 49, dgms. 4*).—This book presents in a popular manner methods of planting home grounds with hardy flowers and shrubs. Directions are given for laying out borders and planting with annuals, perennials, biennials, etc. A feature of the book is that in carrying out the work no greenhouse, hotbed, or cold frame is required.

How to make school gardens, H. D. HEMENWAY (*New York: Doubleday, Page & Co., 1903, pp. XVI+107, pls. 8, figs. 16*).—This is a popular work dealing with the details of making a school garden, such as laying out beds and planting seeds, sowing seeds in window boxes, making cuttings, grafting, and budding. A short bibliography of school-garden literature is appended.

The nature study idea, L. H. BAILEY (*New York: Doubleday, Page & Co., 1903, pp. 159, figs. 2*).—"An interpretation of the new school movement to put the child in sympathy with nature."

FORESTRY.

A German method of oak reproduction, W. F. HUBBARD (*Forestry and Irrig., 9 (1903), No. 4, pp. 199–202, pls. 3*).—A description is given of a method followed in Germany for the substitution of oak forests for beech. The demand for beech timber is a depreciating one, while that for oak is continually increasing and the method described was devised in the neighborhood of Karlsruhe. A portion of the beech forest is annually cut over and put in oak in the following manner: In the autumn before cutting and while the trees are still standing the ground is strewn with acorns which are superficially worked into the ground with picks or mattocks. After the acorns have been scattered and worked in the forest is cut clean, the lum-

bering operations serving to still further work the seed into the ground. The suc ceeding year the ground is heavily covered with a germination of oak and birch, the latter coming in of its own accord. The birch acts as an excellent nurse crop, since it grows faster than the oak and protects the oak seedlings from frost and sudden evaporation. By the time the seedlings are 6 years old they form a complete cover and very dense stand. At this time the poorly developed oaks are topped, the dead ones removed, and the birches cut away. The subsequent growth of the oak trees is looked after, and straight well-developed trunks secured by a continual pruning. At the age of about 50 years the whole area is to be underplanted with beech or spruce to protect the soil, and the oak allowed to develop as a high forest.

The cultivation of the locust tree, L. R. Jones and W. J. Morse (*Vermont Sta. Rpt. 1902, pp. 239–243, fig. 1*).—The authors recommend for certain types of steril soil in Vermont the cultivation of the locust tree (*Robinia pseudacacia*). In 1897 100 seedling trees were set in rows 4 ft. apart each way. At 11 years old they aver aged 16 ft. in height and 5 in. in diameter. Encouraged by this small planting 5,00 more seedling trees were planted in 1902 and 92 per cent of the trees were alive a the time of the report and making rapid growth. This planting was made at a tota expense of from $27 to $32 per acre. Estimates are made of the possible value of th crop which it is believed at the twentieth year will be about $256 per acre. Sugges tions are given for planting, and where there is danger from attacks of insects mixe plantations are recommended in which white and pitch pines, birch, elm and box elder are believed valuable.

The black walnut, G. O. Greene (*Industrialist, 29 (1903), No. 15, pp. 231–238*).— An account is given on the distribution and value of the black walnut, and notes ar given on the rate of growth of a number of trees of known age which have bee measured in different parts of Kansas. On account of the high price of walnut lum ber the author argues that the planting of black walnut trees could be made a profi able investment.

Notes on Pseudotsuga glaucescens, G. Bellair (*Rev. Hort. [Paris], 75 (1903), No. 9, pp. 208, 209, figs. 2*).—A description is given of *Pseudotsuga glaucescens* whic is said to have been derived from the Douglas fir (*P. douglasii*) but is held to b sufficiently distinct to warrant its separation as a species.

A research on the eucalypts, R. T. Baker and H. G. Smith (*New South Wale Dept. Pub. Instr., Technolog. Mus., Tech. Education Ser. No. 13, 1902, pp. XI+29 pls. 46, dgm. 1*).—The results of an extended study of the genus Eucalyptus are give in which the authors treat the systematic classification, hybridization, and evolutio of species, together with their description, and the essential oils produced by ther The species described, of which there are more than 100, are grouped into 8 class based according to the chemical constitution of the oils contained in their leave Special studies are reported on the different constituents of the oils, and the timb and forest characteristics of the different species are briefly mentioned.

A revision of the genus Eucalyptus, I, J. H. Maiden (*Sydney: Govt., 1903, p 48, pls. 4*).—The author has begun a critical revision of Eucalyptus, which is wit out doubt the most important genus of forest trees in Australia. The general habi of the trees are described and their value as timber as well as their economic pr duction is shown. The characters which have been used at different times to aid the classification of the species are mentioned, and a study reported of *Eucalypt pilularis* and *E. pilularis muelleriana*. These species are technically described, a their characters as forest trees and the value of their timber shown.

Progress in national forestry, J. S. Peyton (*Forestry and Irrig., 9 (1903), No. pp. 194–197*).—A review is given of the forest reserves in the United States and th management.

Recent forest reserve consolidation (*Forestry and Irrig., 9 (1903), No. 1, p.* By Presidential proclamation the Teton, Yellowstone, and Absaroka forest reserv

have been consolidated, the total area embraced by the present reserve being about 7,200,000 acres.

Forestry for southern New England wood lots, R. T. FISHER (*Forestry and Irrig., 9 (1903), No. 3, pp. 120, 121*).—When taken as a whole southern New England is said to be more or less covered with an immature growth of mixed hard woods. Few stands are to be found where the trees are more than 60 years old, and fully 75 per cent are of sprout origin. In many places comparatively worthless species of trees have taken possession of the ground to the exclusion of more valuable ones. In order to determine the proper management of these areas the Bureau of Forestry of this Department has caused surveys to be made of 25 tracts in southern New England, and a working scheme has been devised for each. The object in view was to bring the grown-over wood lands into a productive condition. In suggesting methods of treatment an essential consideration was to make the forest have a permanent value to its owner. What is chiefly required for success in these regions is a knowledge of the results to be desired and the ways of bringing them about. Extensive investigations have been carried on in this line which are to be published in a future bulletin of the Bureau of Forestry of this Department.

Forestry at an experiment station, W. MULFORD (*Forestry Quart., 1 (1903), No. 3, pp. 81–86*).—A description is given of the forestry work which has been taken up and developed at the Connecticut State Station. This work was largely the result of legislation which directed the appointment of a State forester and placed in the control of the experiment station the purchase and planting of such lands in the State as are suitable for the production of oak, pine, or chestnut lumber. Under the call for offers of land at a price not exceeding $4 per acre, 24 tracts were offered aggregating about 7,000 acres. These have been examined and negotiations for their purchase are in progress.

The farm wood lot in Michigan, F. G. MILLER (*Forestry and Irrig., 9 (1903), No. 4, pp. 187–189*).—Attention is called to the rapid deforestation of the northern parts of Michigan, and the value of the wood lot particularly in the southern portion of the State is indicated. In the southern part of the State the wooded area is rapidly decreasing, and with the increased value of forest products the author believes that under proper management the wood lot could be made a source of considerable revenue. The preservation and proper management of the natural wood lot as it now exists is said to be more important than artificial plantations, and for the management of such areas the author recommends the system adopted in the management of a successful wood lot in Pennsylvania. This consists of the removal of all dead, diseased, or otherwise undesirable trees, thinning as the trees become crowded, pruning and trimming to secure straight, clear stems, and the underplanting of all vacant and thin spots with some valuable tree, usually the white pine.

Minnesota's system of preventing forest fires, C. C. ANDREWS (*Forestry and Irrig., 9 (1903), No. 2, pp. 84, 85*).—The Minnesota system for preventing forest fires is now in operation over about 9,000,000 acres of forest lands, and the execution of the law is placed in the hands of the town supervisors who are made fire wardens. A chief fire warden is provided for by the law and it is made his duty to investigate the various aspects of forestry and report annually to the proper State authorities. The present appropriation for carrying out this law is $5,000, and a scale of compensation is given by which citizens who are called upon to help extinguish or control fires are remunerated. A considerable part of the expense of fighting fires is charged against the county, and the writer thinks that the law would be more effective if the State should pay two-thirds of the expense and the counties one-third.

The most profitable trees for planting on the waste lands of farms in New Jersey, F. R. MEIER (*Proc. New Jersey State Hort. Soc., 28 (1903), pp. 208–215, pl. 1*).—According to the author, there is considerable land in New Jersey which is not adapted to general agriculture and it is thought possible that it may be made more

productive by planting it with trees. Some of these areas are described, and the planting of willow, cottonwood, black locust, black walnut, tulip tree, yellow and white pines, and white cedar is recommended. Particular stress is paid to the planting of willows for osier purposes. The methods for preparing the ground are described, as well as the distance of planting, and subsequent cultivation and preparation for market. A report is given of a 15-acre osiery planted 8 years before at an expense of $73.60 per acre which yields annually a net profit of $85 per acre.

Forestry in Ohio, W. R. Lazenby (*Forestry and Irrig., 9 (1903), No. 2, pp. 99, 100*).—According to the writer, less than 14 per cent of the area of Ohio is forested and the destruction of this small proportion is still going on. Attention is called to the desirability of retaining forests, and forest planting for timber, shelter, and ornamentation is recommended. The different kinds of lands and different methods of planting for these purposes are described. In order to foster scientific foresting the author recommends the exemption from taxation of a certain percentage of wood land on each farm, the appointment of a State commissioner of forestry, the establishment of a school of forestry in connection with the State university, the establishment of a State arboretum where every species of forest tree could be grown, and the securing by the State of large tracts of cheap lands to be managed as State reserves for permanent forests.

Conservative lumbering at Sewanee, Tennessee, J. Foley (*U. S. Dept. Agr. Bureau of Forestry Bul. 39, pp. 36, pls. 12*).—An account is given of the results of the management of the forest owned by the University of the South, at Sewanee, Tenn., the work being carried on under direction of the Bureau of Forestry of this Department. The forest in question had been badly used and was steadily declining in value. In 1900 the Bureau of Forestry undertook its management, the principal condition being that it should be done at no cost to the university. A plan of management was devised which has proved profitable and has left the forest in good condition after lumbering. When the cooperative plan was begun a conservative estimate of $3,000 was the value placed upon the timber. Under the plan of management a net profit in 1900–1 of $1,500 was secured, the following year about $1,200. It is said that 4 years more of lumbering remain to be done and for at least 3 years the annual profit should be about $1,500 a year, making the forest yield a profit of about $7,000 from timber formerly valued at $3,000. These profits were made possible through the careful planning of the lumbering in order to prevent waste and to secure the largest returns from the merchantable trees. In all the cuttings provision was made that the land should again produce valuable timber.

The report describes the forest in detail, enumerating the various species of trees, their characteristics and distribution, and gives recommendations for the future management of the tract. The recommendations can not be considered specific for the management of similar tracts in other regions of the South. The effects of fire, overgrazing, insect injuries, and improper cutting are described, and the methods of lumbering which were adopted are given at considerable length.

Evidence taken before departmental committee of the board of agriculture on British forestry (*London: Wyman & Sons, Ltd., 1903, pp. IV+24, dgms. 4*).—This consists of the evidence taken before a departmental committee appointed by the board of agriculture to inquire into and report upon the condition of British forestry. The general impression is given that the management of British forests is unskillful and that it could be readily improved. This condition is due to a great degree to the fact that the wood lands are not always planted or managed for revenue, but often as game preserves or for ornamental purposes. The forests of Scotland on the whole are said to appear better than those in England, but, according to the evidence, while the planting in Scotland is to be commended there is much subsequent mismanagement. Public forests are well managed on the whole as is shown by reports of the condition of different crown lands.

The effect of deforestation on climate is mentioned and attention called to the fact that the forest area of Great Britain is considerably smaller than is believed to be the proper proportion for the best agricultural conditions. Considerable attention is paid to the subject of planting, in which it is shown that the cost of planting ranges from $7.20 to $20 per acre, as it appears from the returns from a number of large plantations. Among the species suggested for extensive planting the Scotch fir and larch are generally recommended, although the larch suffers considerably by disease. In addition to these trees a number of species of pines, as well as silver fir, cedar, and hard woods, are recommended.

In the appendices supplemental statements are made on a number of subjects, such as the relative merits of British and foreign timbers, the income from a mixed larch and fir wood at the end of its seventy-fifth year, receipts and expenditures from the clearance of an 18-acre mixed forest of about 75 years' growth, suggestions for the improvement of British forestry, outline of courses in forestry, description of various schools of forestry and their courses of instruction, timber tests of telegraph poles and cross arms, and area of crown forests in the United Kingdom.

Report of the forestry bureau July 1, 1901, to September 1, 1902, G. P. Ahern (*War Dept., Bureau of Insular Affairs, Philippine Com. Rpt. 1902, pt. 1, pp. 451–527, pls. 37, map 1*).—A detailed report is given of the progress made by the bureau of forestry during 1901–2. Numerous additions to the scientific staff are noted and also the organization of several new divisions and laboratories. The personnel of the scientific and administrative staffs is shown, the administrative staff consisting of 4 assistant inspectors, 10 assistant foresters, and 65 forest rangers.

Descriptions are given of the facilities provided for work in the different lines of investigation. Summaries are given showing the licenses granted between July 1, 1901, and August 31, 1902, for cutting timber, also the number of sawmills, employees, output, market value and income derived by the Government from all franchises for the utilization of forest products. The revenue derived during the time covered by the report was $348,073.08 Mexican, the Government charges being between 5 and 10 per cent of the market price of the timber in Manila. Valuation surveys have been begun and the results already obtained indicate a conservative estimate of an average stand of 3,500 cu. ft. of timber 20 in. in diameter, on over 20,000,000 acres of virgin forest. The total forest area of the archipelago is estimated at 48,112,920 acres, less than 1,000,000 of which is held by valid private title.

The forests are described and their principal species indicated, together with their groupings under the forest regulations adopted by the bureau. A preliminary working plan of Bataan Province, prepared by R. C. Bryant, is given in which the necessary operations for conservative lumbering are described. Investigations by P. L. Sherman on the forest products of the islands are also reported, particular attention having been given to the gutta-percha industry, the permanency of which is threatened by wasteful methods of exploitation.

Progress report of the forest surveys in Bengal, India, 1901–2, P. J. Gordon (*Calcutta: Supt. Govt. Printing, 1903, pp. 17, map 1*).—A progress report is given of forest surveys in India for 1901 and 1902 in which the character of the survey is indicated, and the extent of the surveyed and unsurveyed forest area is shown. The cost of the survey by provinces is given. The survey during the period covered by this report was quite extensive, and attention is called to the fact that it will be impossible to continue the work at the present rate without more adequate provisions for carrying on the work.

The production of timber in Algeria, J. Trabut (*Bul. Agr. Algérie et Tunisie, 9 (1903), Nos. 2, pp. 25–28; 3, pp. 55–59*).—A description is given of the forest conditions of Algeria, and attention called to the rapid disappearance of the Algerian forests wherever they occur in accessible regions. On account of the disappearance of trees of a size adapted to construction timber, the author suggests the artificial

planting and describes a number of species which either have been tried or are believed to be adapted to Algerian conditions.

The forester and the lumberman, G. PINCHOT (*Forestry and Irrig., 9 (1903), No. 4, pp. 176–178*).—An address, in which the author points out the necessity for cooperation between the lumber industry and the scientific forester, in order to secure the greatest measured benefits to both. A review is given of the methods of forestry and some of the results already obtained in this country. Attention is also called to the forestry operations conducted under governmental authority in the Philippines.

A profitable cutting of insect-killed timber, A. CARY (*Forestry and Irrig., 9 (1903), No. 3, pp. 149, 150*).—An account is given of a method of lumbering by which timber destroyed by bark beetles was profitably lumbered and at the same time the ravages of the bark beetles greatly reduced. The presence of the bark beetles in the spruce forests has been known for about 15 years, their ravages constantly increasing. In some tracts fully half the standing timber has been destroyed. The author arranged for the cutting of a considerable portion of dead timber, which belonged to the Berlin Mills Company, in such a way that the expense was not so great that contractors would be unwilling to undertake the lumbering. The ravages of the bark beetle appear to spread from centers, so that nearly all the trees in definite regions would be destroyed. By cutting these, together with enough green timber to justify the lumbering, it was found that contractors would undertake the necessary operations.

Preservation of soil fertility in plantations, A. C. FORBES (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 69–94*).—An argument in favor of more attention to the preservation of fertility in the soil of forest plantations.

Shade tree suggestions, A. NELSON (*Wyoming Sta. Bul. 57, pp. 14, pls. 5*).—This bulletin is prepared to show what may be done in improving the conditions of Wyoming in the way of street, lawn, and other plantings, the principal object being to give impetus to the movement for the ornamentation of homes, municipal buildings, parks, etc.

Creosoting timber, S. W. LABROT (*Tradesman, 49 (1903), No. 6, pp. 77, 78*).—A description is given of the processes of treating timber by the zinc-creosote method. This consists in two operations—the sterilizing and drying of the timber and the forcing into the wood of the antiseptic chemical. In sterilizing the timber great care must be taken to avoid overheating, as excessively high temperatures have a very damaging effect upon the strength of the timber. This is particularly true of those which contain resinous substances. These resins are evaporated at about 305° F. and their removal greatly weakens the structure of the wood. After sterilization the chemical is forced into the wood under pressure, and in the method described zinc chlorid is mentioned as the cheapest and most common substance used in this country. Timber treated in this manner is said to have its durability increased by 12 to 16 years in the case of white pine railroad ties, or from 18 to 30 years in railroad structural timbers.

SEEDS—WEEDS.

Timothy, alsike, and red clover seeds, G. H. CLARK (*Canada Dept. Agr., Comr's Branch, Seed Division Bul. 8, n. ser., pp. 30*).—The purpose of this bulletin is to call attention to the trade conditions in timothy, alsike, and red clover seeds, and to give the results of analyses of more than 500 samples of seeds collected from various parts of Canada. A summary is given of the methods of seed testing and seed control that have been adopted in other countries, and other information which it is believed would be helpful to seed growers, merchants, and consumers. Inquiries were sent to a large number of correspondents from whom 513 samples were received

and subjected to the usual seed analysis. Tables are given showing the market price of different lots of seed, the percentage of germination, number of weed seeds, and the actual cost of the living seed per bushel. A list is given of 25 of the principal weed seeds found in the different lots of seed and the proportion in which they occurred in the different samples.

Seed-testing stations in Hungary, J. SPEIR (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 53–62, fig. 1*).—An account is given of the organization of seed-test laboratories in Hungary, their equipment and methods are described, and results of tests shown. Tables are also given in which the rate of compensation demanded for making tests, together with the form of the report given for all seed testing, are shown.

Rules for seed examinations adopted by Danish seed control stations (*Tidsskr. Landbr. Planteavl, 8 (1902), pp. 223–233*).

Influence of the remedies employed in combating smut on the germination of seeds, B. MEZENTZOV (*Yuzh. Russ. Selsk. Khoz. Ghaz., 1902, No. 42; abs. in Zhur. Opuitn. Agron. [Jour. Expt. Landw.], 3 (1902), pt. 6, pp. 738, 739*).—The author presents results of experiments carried out on the Derebchinsk experiment field and at the Sobyeshinsk Experiment Station. Seeds were treated with copper sulphate solutions and were soaked with hot water. In one case the following results were obtained: (a) In dry earth there germinated: Nontreated seeds 80 per cent, soaked in copper sulphate solution 36 per cent, soaked in vitriol and washed with lime water 46 per cent, dipped in hot water 82 per cent. (b) In moist earth: Nontreated seeds 95 per cent, soaked in copper sulphate solution 75 per cent, soaked in copper sulphate solution and washed with limewater 85 per cent, steeped in hot water 96 per cent. Other series of experiments gave approximately the same results.—P. FIREMAN.

On the influence of salt water on the viability of seeds, O. ROSTRUP (*Tidsskr. Landbr. Planteavl, 8 (1902), pp. 37–40*).

On the viability of seed buried in the ground, O. ROSTRUP (*Tidsskr. Landbr. Planteavl, 8 (1902), pp. 35–37; 9 (1902), pp. 27–29*).

On the viability of weed seed, O. ROSTRUP (*Tidsskr. Landbr. Planteavl, 8 (1902), pp. 33–35*).—A cow was fed freshly cut weeds of different kinds and for 5 days the manure was examined for weed seeds. The viability of the weed seeds and other seeds found in 217 gms. of dung was subsequently determined. The total number of seeds and their viability are shown in the accompanying table:

Viability of weed seed from cow dung.

Name of seeds.	Total number of seeds.	Viability.	Name of seeds.	Total number of seeds.	Viability.
		Per cent.			*Per cent.*
Solanum nigrum	3,355	52	*Plantago major*	125	87
Chenopodium album	1,270	51	*Atriplex patula*	119	8
Stellaria media	377	49	*Veronica agrestis*	44	25
Sonchus asper	209	27	*Spergula arvensis*	44	9
Senecio vulgaris	191	5	*Polygonum aviculare*	31	35
Thlaspi bursa-pastoris	166	24	*Petroselium sativum*	21	86
Urtica urens	164	11			

A large number of other seeds were identified, but being found in only small numbers the results of the determinations of viability can not be considered of general value. In order to ascertain whether the length of time during which the seeds remain in the digestive tract influences the results of the viability determinations, the germination of seeds of *Solanum nigrum* on subsequent days was determined, with results as follows: First day after feeding, 48 per cent; second day, 53

per cent; third day, 55 per cent; fourth day, 52 per cent, and fifth day, 5 out of 7 seeds germinated. The percentage viability of seeds does not therefore appear to differ whether the seeds take 1 or 5 days to pass through the digestive tract of the cow.—F. W. Woll.

Notes on weeds, W. Carruthers (*Jour. Roy. Agr. Soc. England, 63 (1902), pp. 279–288, figs. 8*).—Illustrated notes are given of a number of the more troublesome weeds to which the author has had his attention called by means of specimens received and inquiries regarding the habits and methods for eradication. A brief study is also reported on the British brome grasses and a key is added for the determination of the different species known to occur within the Kingdom.

Killing weeds in lawns, L. R. Jones and W. J. Morse (*Vermont Sta. Rpt. 1902, pp. 243–248, figs. 2*).—Notes are given on the destruction of chickweed and crab grass in lawns. For the destruction of chickweed raking the lawns or sowing them with salt, or both methods combined, were found effective when made the last week of June. The application of 2 qt. of salt to the square rod, followed by thorough raking of the chickweed and a liberal sowing of grass seed, was completely successful in exterminating chickweed and in securing a full stand of grass. It is suggested that where salt is used on a lawn it should be done cautiously on a small scale, as the effects will vary in different soils and seasons. For the eradication of the crab grass the authors suggest care in selection of seed to avoid the introduction of this plant, which is an annual; the use of grass seed, fertilizer, and water freely so as to keep the grass in vigorous growth; and the hand weeding of the crab grass if it should appear.

DISEASES OF PLANTS.

Report of the vegetable pathologist, D. McAlpine (*Jour. Dept. Agr. Victoria, 1 (1902), No. 8, pp. 801–808, pls. 2*).—Among the subjects reported upon an account is given of experiments on the resistance of varieties of wheat to the rust, and the fact is brought out that so far as economic importance is concerned the only rust occurring in Victoria is that known as summer rust (*Puccinia graminis*). So far as it has been determined this rust, which is very abundant in Australia, produces uredospores—which would retain their vitality only during comparatively mild weather—and teleutospores, but the relationship between the teleutospores and the subsequent production of rust has not been determined. Notes are also given on the treatment of grain for the prevention of stinking smut, formalin, copper sulphate, and corrosive sublimate solutions being used. The different solutions were efficient in preventing the occurrence of stinking smut, but the most satisfactory treatment was that where the seed was soaked for 10 minutes in a solution of 1 lb. of formalin to 100 gal. of water. Notes are given on the black spot of apples and pears due to *Fusicladium* sp., as well as the bitter rot of apples.

Attention is called to experiments for the prevention of a fungus disease of grasses. This fungus (*Isaria graminiperda*) is figured and described, and it is shown that a liberal application of nitrogenous manures, sulphate of ammonia being the most satisfactory, gave absolute exemption from attacks of the fungus. The application of the fertilizer not only prevented the occurrence of the disease but stimulated a greater production of forage.

The diseases of cultivated plants, G. Delacroix (*Maladies des plantes cultivées. Paris: Min. Agr., 1902, pp. 73, figs. 81*).—Illustrated descriptive notes are given of a large number of diseases of cereals, potatoes, beets, forage plants, vegetables, orchard and vineyard fruits, etc., together with brief suggestions of the most approved methods of combating these troubles.

Notes on some important plant diseases of the Tropics, F. Noack (*Ztschr. Pflanzenkrank., 12 (1902), Nos. 4, pp. 227–234; 5, pp. 285–291*).—Brief critical notes are

given on recent investigations in many tropical countries of some of the more important diseases of economic plants. Among those reviewed are the diseases and insects affecting coffee, cacao, tea, sugar cane, cotton, pineapples, bananas, citrus fruits, rubber trees, and cork oak.

Notes on some plant diseases, K. MALKOFF (*Ztschr. Pflanzenkrank., 12 (1902), No. 5, pp. 282–285, fig. 1*).—Brief notes are given on a number of diseases of plants which the author observed in the vicinity of Göttingen. The first described is the anthracnose of clover due to *Glœosporium caulivorum*. The author claims that red clover grown from seed from different countries seems to be unequally affected, that from eastern North America being most subject to disease, while the south Russian, Polish, and Canadian was least attacked. In addition to the red clover, the author reports the fungus as attacking *Trifolium purpureum* and *T. medium*. The early mowing of clover fields is recommended to prevent the spread of the disease. A second disease which also attacks clover is due to the fungus *Macrosporium sarcinæforme*. This fungus attacks the leaves, giving them a ragged appearance and later causing them to turn brown and fall from the plants. Inoculation experiments were carried on with cultures of this fungus which seem to demonstrate that it was due to this particular organism. The third disease described is that of leaf spot of rye, caused by the presence of *Rhynchosporium graminicola*. The extent of injury due to this cause was not determined.

The distribution of the anthracnose of red clover, G. LINHART (*Ztschr. Pflanzenkrank., 12 (1902), No. 5, pp. 281, 282*).—The distribution of *Glœosporium caulivorum*, the cause of clover anthracnose, or stem browning, as it is called, is said to cover practically all of Europe wherever red clover is grown. The author says that plants grown from American or European seed suffer alike and in some places as much as 50 per cent of the plants were observed to be dead as a result of the fungus. Weather conditions are said to exert an important influence on the occurrence of the diseases, unusual wet weather greatly favoring its spread. So far as the author's observations go, alfalfa does not appear to be subject to this disease. The fungus attacks all of the above-ground parts of the plant, the stems and petioles in particular, causing them to turn brown as though burned. There is thought to be some evidence of the transmission of the disease by means of infected seed, and it is recommended that seed be treated with a 1 per cent solution of Bordeaux mixture before sowing.

Investigations on cereal rusts, E. MARCHAL (*Bul. Agr. [Brussels], 19 (1903), No. 1, pp. 114–153*).—After briefly reviewing the present status of the cereal rust problem the author gives descriptions of the more common species which he has investigated. Among those described are the black rust (*Puccinia graminis*), brown rust (*P. triticina*), yellow rust of wheat (*P. glumarum*), brown rust of rye (*P. dispersa*), pale rust of barley (*P. simplex*), and crown rust (*P. coronifera*). Most of these rusts have specialized forms which are also described. Analytical keys are given for the determination of the kind of rust found upon a plant, and a tabulated statement is presented showing the distribution and frequency of occurrence of the different species in Belgium.

The author states that wheat is most frequently attacked by the brown rust, followed by the yellow and black rusts in order of frequency. The figures upon which this conclusion is based are the averages of observations made during 2 seasons although slight differences are noted, particularly in the relative occurrence of the yellow and black rusts. Upon the rye the principal species is the brown rust, the black rust being rather rare and spasmodic in its appearance. The common barley rust is the pale rust which was found present in 92 per cent of all the specimens examined. The black rust is frequent in certain years, while the yellow rust which is so destructive in Sweden is unknown in Belgium. The oats suffer most from the crown rust, and the black rust is comparatively rare. The varying susceptibility of

different varieties to disease is shown and the influence of soils, meteorological conditions, fertilizers, seeding, etc., on rust development are discussed. The rôle of barberry and boraginaceous and other plants on the alternate generations of the rust fungus is commented upon at considerable length. The losses due to cereal rusts are discussed and suggestions given for their prevention. Among the suggestions offered are the sowing of resistant varieties, early seeding, and rational fertilizing.

The treatment of stinking smut in wheat, J. Reed (*Colorado Sta. Bul. 79, pp. 8*).—A description is given of the stinking smut of wheat caused by *Tilletia fœtens*, and 2 methods of treating the seed for smut prevention are described. In these treatments the seed was either soaked or sprinkled with solutions of copper sulphate, corrosive sublimate, potassium sulphid, and formalin. The results obtained showed the efficiency of copper sulphate, corrosive sublimate, and formalin, and demonstrated that potassium sulphid, besides being very expensive, is not an efficient remedy. Sprinkling the solutions over the grain and thoroughly mixing by raking or shoveling is recommended as the quickest and easiest, as well as most efficient treatment.

Potato diseases and their remedies, L. R. Jones and W. J. Morse (*Vermont Sta. Rpt. 1902, pp. 209–230*).—A report is given of the potato diseases as they occurred in 1901 and 1902, the results of spraying experiments, the relation of date of digging to development of potato rot, the effect of top pruning potatoes, and potato scab experiments. During 1901 and 1902 there was an unusual prevalence of the late blight and rot due to *Phytophthora infestans*, and the conditions are believed favorable for the destructive occurrence of the disease in 1903 unless the summer should be an unusually dry one. In order to prevent serious losses from this cause the authors suggest the selection and saving of seed from the earlier planted crop on light soils so that there will be as little fungus as possible introduced to the seed potatoes, and the thorough spraying of the plants with Bordeaux mixture during the season.

The spraying experiments reported were begun in 1901, comparison being made between Bug Death and a Bordeaux-Paris-green mixture. The results are given at some length, from which it appears that although Bug Death was used in very large amounts its inefficiency as a fungicide was demonstrated. During the second year the spraying experiments were continued but Bordeaux mixture and Paris green alone were used. The results of these experiments are shown and a tabular statement is given showing the average gain for 12 years attributed to the use of Bordeaux mixture on late potatoes. The average increased yield attributed to this cause was 115 bu. per acre.

While carrying on the spraying experiments during the summer the soil of certain rows was sprayed to ascertain whether this treatment would prevent the development of the spores falling upon the soil and reaching the tubers. The results obtained are not considered conclusive, and although there was some evidence of eradication of disease this method of spraying is not recommended as practicable.

The question of how soon blighted potatoes should be dug has been frequently asked the authors, and a series of investigations was undertaken to ascertain the proper time of digging. The size of the plats and the extent of the experiment are considered too limited to admit of generalizations, but it appears that there was usually a greater loss from the earlier digging. So far as the investigations go, they seem to show that where there is danger of potato rot it is best to delay the digging for 10 days or more after the tops have died.

The effect of top pruning was studied on account of the unusual luxuriance of the potato tops, especially where they had been properly sprayed. The common belief was expressed that such a growth would interfere with the production of tubers, consequently the stalks of alternate rows were clipped back so as to present only about a foot of growth above the soil. The yield from the different rows at harvest is shown, from which it appears that practically $\frac{1}{3}$ of the crop was sacrificed by the cutting of the tops.

Potato scab experiments were carried on during the seasons covered by the report in which the susceptibility of different varieties was tested. In 1901 11 varieties were tested and in 1902 14 varieties. A comparison of the results shows considerable difference in the behavior of the different varieties, and the results are such as to lead to the hope that scab-resistant varieties may be secured by breeding and selection. Disinfection experiments in which formalin, corrosive sublimate, and formaldehyde vapor were tested for scab prevention were carried on and, as in all previous trials, both corrosive sublimate and formalin solutions proved equally efficient. The experiments with sulphur fumes and formalin vapor are to be continued.

Diseases of the potato in Ireland, T. JOHNSON (*Jour. Dept. Agr. and Tech. Instr. Ireland, 3 (1902), No. 1, pp. 8–21*).—Attention is called to a number of diseases of potatoes which occur more or less abundantly in parts of Ireland, at times causing serious losses. The potato blight (*Peronospora infestans*) and the sclerotium disease (*Sclerotinia sclerotiorum*), as well as the bacterial and Rhizoctonia diseases of potato are described, and an account given of the attack of *Phellomyces sclerotiophorus* upon the potato. So far as the author is aware this fungus has not previously been observed in Great Britain, and while truly parasitic may cause considerable unsuspected damage to the potato crop. It gives rise to a skin disease or scab of the potato tuber, followed by the rotting of the potato. In the earlier stage the presence of the fungus is indicated by the appearance of white shining patches on the skin of the tubers, and later the epidermal layers peel off leaving the underlying tissues exposed to the rot fungi. The disease may be carried over from one crop to another by planting with infected tubers and care should be taken to exclude them when observed.

Notes are given on a number of diseases of other plants, most of which are of common occurrence.

Some diseases of the potato and of fruit trees, A. LINTON (*Jour. Khediv. Agr. Soc. and School Agr., 4 (1902), No. 5, pp. 197–208, pls. 4*).—A description is given of a number of diseases of the potato and of various fruit trees that are caused by attacks of fungi, insects, or other animals. Among the diseases of the potato the most loss is occasioned by attacks of the early blight (*Macrosporium solani*). The early planting of potatoes, the use of less susceptible varieties, and spraying with Bordeaux mixture are recommended as preventive measures. The enemies of the fruit trees described are mostly insects, stem borers and scale insects predominating, with notes on peach-leaf curl, plum rust, grape downy mildew, etc.

A new fungus disease of potatoes, R. S. MACDOUGALL (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 312–319, figs. 4*).—A description is given of a disease of potatoes caused by the fungus *Chrysophlyctis endobiotica*. This disease has been previously described (E. S. R., 14, p. 979), and attributed to attacks of this fungus as well as to *Œdomyces leproides*. The life history of the fungus is described, and its occurrence on the potato crop is said to have first been noticed in 1899. In 1900 it was less abundant, but in the following years was quite prevalent. It is characterized by a peculiar warty outgrowth in the tubers, and commences about July or August, developing with the potatoes. Infection is usually through the eyes of the tubers, and may result in warty excrescences that are sometimes even larger than the potato itself. The disease is likely to manifest itself most seriously in damp places, although no perceptible deficiency has been noticed in the crop. After the potatoes are dug there appears to be no further development of the disease, nor do the affected potatoes seem more liable to decay. In planting the seed tubers should be carefully examined, and all affected ones rejected.

A bacterial disease of sugar beets, G. G. HEDGCOCK and H. METCALF (*Ztschr. Pflanzenkrank., 12 (1902), No. 6, pp. 321–324*).—A description is given of a disease of sugar beets which was recognized by the authors in various parts of Nebraska during the autumn of 1901 and later reported to them as occurring in Arizona and Colorado. As a result of the attacks of the bacteria the roots begin rotting at their tips and later the leaves and all the above-ground parts of the beets become entirely infested. The

organism, which has been isolated and cultivated through various media, is described at some length. The bacterium seem to be somewhat similar to that described by Kramer as the cause of bacteriosis of beets, but differs in being anaerobic, growing upon gelatin and potatoes and developing a brown pigment with the evolution of gas on sugar-beet cylinders. The disease seems to be most prevalent in wet soils and it is possible that the draining of these soils would tend to the restriction of the organism.

Nematode diseases of bananas, sugar beets, etc., V. Mosseri (*La maladie vermiculaire. Cairo: Inst. Français, 1903, pp. 40, pls. 3, figs. 4*).—An account is given of nematode diseases of bananas, sugar beets, and a number of other economic plants which are caused by the presence of the nematode *Heterodera radicicola*. The effect of these parasites upon their host plants is described, and a complete description is given of the organism and its life history. Mention is made of 31 families of plants, embracing more than 100 species, which are known to the author to be subject to the attacks of this nematode. The effect of the disease on the composition of sugar beets is shown by analyses, and suggestions are given for combating the trouble. These consist in sterilizing the soil wherever possible, the rotation of crops, submersion of land from irrigation ditches, use of certain fertilizers, naturally resistant varieties, etc.

Nematodes in out-of-door plants, A. Osterwalder (*Ztschr. Pflanzenkrank., 12 (1902), No. 6, pp. 338–342, figs. 5*).—The occurrence of nematodes in the leaves, stems, and flowers of a number of wild plants is mentioned, and their effect upon the appearance of the plant is described. The species of nematode most commonly observed was *Tylenchus devastatrix*.

Anagallis arvensis as a host plant for stem nematodes. C. J. J. Van Hall and M. W. V. Van Bijlevelt (*Tijdschr. Plantenziekten, 8 (1902), pp. 144–149, pl. 1*).—The authors found that *Anagallis arvensis*, a common weed, especially on the light soils used for onion and hyacinth culture, was a favorite host plant for the nematode *Tylenchus devastatrix* that is so injurious to the onion and hyacinth culture. This fact is thought to account for the difficulty of ridding infected land of the nematode, even after years of cultivating with immune crops.—H. M. Pieters.

Some diseases of sugar cane in the West Indies, A. Howard (*Ann. Bot., 17 (1903), No. 66, pp. 373–411, pl. 1*).—An account is given of the "rind" disease of sugar cane and also a root disease which is quite prevalent. The author claims that the Melanconium found on diseased sugar canes in the West Indies is not the cause of the rind disease, as has been claimed by other authors, but it is wholly saprophytic in its growth. The phases of *Trichosphæria sacchari*, which are claimed to be identical with those of *Thielariopsis ethaceticus*, cause a disease of cane cuttings in the West Indies which is identical with the pineapple disease of cane cuttings in Java and in addition the fungus is parasitic on the growing cane. The rind disease of the sugar cane in the West Indies is identical with that known as red smut in Java, and is caused by the fungus *Colletotrichum falcatum*. This fungus readily attacks ripening canes at wounds and at the old leaf bases, as well as the young canes which are capable of active growth. The Melanconium referred to above infects the canes at the points where they have been invaded by the Colletotrichum. The common root disease of sugar cane in Barbados is that caused by the fungus *Mirasmius sacchari*. Under certain conditions the mycelium of this fungus attacks the growing tissues of the roots, causing their destruction.

The gummosis of the sugar cane, R. G. Smith (*Proc. Linn. Soc. New South Wales, 27 (1902), pt. 1, pp. 31–47, pls. 2*).—A description is given of the disease of sugar cane caused by *Bacterium vasculorum*. The substance of this paper has been previously noted (E. S. R., 14, p. 876).

An ascobacterium from the sugar cane, R. G. Smith (*Proc. Linn. Soc. New South Wales, 27 (1902), pt. 1, pp. 137–145, pl. 1*).—A description is given of *Bacterium sacchari*, n. sp., which has been noted elsewhere (E. S. R., 14, p. 876).

A gum-forming bacterium from Eucalyptus stuartiana, R. G. Smith (*Proc. Linn. Soc. New South Wales, 27 (1902), pt. 2, pp. 230–236, pl. 1*).—A description is given of *Bacterium eucalypti*, n. sp., which is found in the saccharin exudate of *Eucalyptus stuartiana*. The occurrence of this organism has been previously mentioned (E. S. R., 14, p. 876).

The bacterial origin of gums of the arabin group, R. G. Smith (*Proc. Linn. Soc. New South Wales, 27 (1902), pt. 3, pp. 383–407*).—A study was made of various gums to determine the possibility of their bacterial origin. Fresh material was obtained from *Acacia penninervis*, and from the twigs of this tree small portions of gum were removed, the exterior portion sterilized, and cultures made from the fragments. In nearly every case 2 forms of bacteria were found present. The first, to which the name *Bacterium acaciæ* is given, the author believes is the cause of the production of the principal portion of the gum found on this plant. This organism in the laboratory was found to form a gum which behaved in all its reactions the same as the natural gum. The formation of gum on this tree is considered a bacterial disease, the bacteria elaborating the plant juices into gum which resembles the gum arabic in its properties.

The second organism, to which the name *B. metarabinum* is given, is believed to produce the more insoluble gums which occur associated with the others. In conclusion the author states that gums of the arabin group occur not only in the Acacias, but among other plants, particularly certain Rosaceæ, and he believes it probable that they are produced by the work of similar organisms to those described above.

Cucumber diseases, G. E. Stone (*Massachusetts Sta. Bul. 87, pp. 29–42, figs. 8*).—Descriptions are given of a number of cucumber diseases, particular attention being paid to those occurring on cucumbers grown under glass. Among those described are a leaf curl, in which the leaves assume a spherical form due to the inrolling of the wilted edges of the leaves; a stem curl, which is said to be a more pronounced form of the same disease; and a cucumber wilt, all of which are attributed to improper conditions of cultivation. Among the diseases caused by fungi are the anthracnose, downy mildew, timber rot, damping off, powdery mildew, nematode diseases, etc. These different diseases are described and preventive means suggested where such are known. The author recommends the fumigation of the houses before planting with sulphur or potassium cyanid. The sulphur treatment is less expensive, but for most purposes the cyanid is to be preferred. Either of the treatments will remove some of the more common pests of greenhouses, and it is believed that growers will find the practice of fumigation highly advantageous.

Orchard diseases and their remedies, L. R. Jones and W. J. Morse (*Vermont Sta. Rpt. 1902, pp. 230–239*).—A description is given of the destructive presence of the apple scab fungus during the summer of 1902. Owing to the excessive amount of rainfall spraying was much interfered with, and in many cases where applications of Bordeaux mixture and Paris green were made early in June a rusting or russeting of the fruit was reported and in a few cases there was a decided spotting of the foliage. Similar troubles were reported during the season from a number of localities, and after a careful examination the authors reached the conclusion that the trouble is due primarily to weather conditions and is aggravated by the spraying. An inspection of the orchards of Grand Isle gave abundant evidence of gain from spraying, and while there was a serious amount of damage due to the russeting the quality of the well-sprayed fruit was much higher than that from the unsprayed. The experience derived during the season suggests that the strength of solutions should be varied to suit the period of growth, climatic conditions, and fineness of the spray. The coarser the spray the weaker should be the solutions, and in early spring stronger mixtures may be used than during the summer.

Studies are reported upon plum blight which have already been noted (E. S. R., 14, p. 880).

A destructive apple rot following scab, H. J. EUSTACE (*New York State Sta. Bul. 227, pp. 367–389, pls. 9*).—During the autumn of 1902 in western New York there appeared a white, mildew-like fungus upon apples which was associated with the scab which had been unusually prevalent during the season. There was no relation between the 2 fungi except that the apple scab, by breaking the epidermis, made it possible for the second fungus to infest the fruit. An examination showed that this new disease was caused by the fungus *Cephalothecium roseum*, a fungus which had hitherto been regarded as a saprophyte. A description is given of the organism and the effect which it produces, as well as statements regarding the susceptibility of various varieties to the disease. Rhode Island Greening, Fall Pippin, and Fameuse seemed more affected than any other varieties, the Rhode Island Greening suffering by far the most.

While the author's investigations were confined to western New York, replies which were received from a number of other localities indicate that the same trouble existed in Michigan, Ohio, and Nebraska. The fungus, which grows commonly as a saprophyte, was studied and attempts made to discover its means of being carried over from season to season. So far the author has been unable to find the organism on any portion of the apple tree except its fruit, but it has been reported as occurring on maple trees in a way that suggests it may possibly be parasitic. This point will be determined by subsequent investigations. The fungus has been found saprophytic on the black knots of cherry and plum trees, as well as on firewood, and also on the fruiting pedicels of grapes.

Inoculation experiments are reported in which the rot was easily produced, and preventive measures are suggested. Spraying the trees for the prevention of scab would greatly reduce the liability of attacks of rot, and the apples when gathered should be carefully assorted and placed in cold storage where a dry, low temperature would restrict the further development of the fungus. The effect of dipping apples in solutions of copper sulphate and of formalin was tested in which different strengths of solutions were used, and both the fungicides materially checked the growth of the fungus. A soft rot caused by *Penicillium glaucum* made its appearance upon the treated apples, being more abundant upon those than upon the check.

Apple troubles in 1902, F. H. HALL, F. C. STEWART, and H. J. EUSTACE (*New York State Sta. Buls. 220 and 227, popular ed., pp. 8, pls. 4*).—This is a popular edition of previous publications (see above and E. S. R., 14, p. 774).

Botanical investigations on fruit diseases (*Illinois Sta. Circ. 67, pp. 15–1[illegible] fig. 1*).—The botanical investigations reported were mostly made upon the bitter-rot fungus, preliminary accounts of which have already been given (E. S. R., 14, pp. 367, 581). Some other diseases were studied, among them the black rot, brown rot, apple canker, etc. Investigations were also conducted on the effect of spraying fruit trees while in bloom, the results obtained showing that spraying during the blossoming period prevents the setting of fruit in the case of those blossoms which have but recently opened. The fungicide seems to kill the stigmas and prevents the germination of the pollen.

Spraying for bitter rot (*Illinois Sta. Circ. 67, pp. 10–15*).—A brief report is given of the spraying which has been carried on by the station during 1901 and 1902 for the control of the bitter rot of apples. In 1902 the value of different times and numbers of applications was investigated, the work being carried on in 3 different orchards. The fungicide used was Bordeaux mixture composed of 4 lbs. of lime, 4 lbs. of copper sulphate, and 50 gals. of water.

In one orchard the trees sprayed were Ben Davis and Huntsman, the latter being extremely susceptible to bitter rot. A tabular statement shows that the Ben Davis trees sprayed 5 times before the appearance of the rot and once afterwards contained 3.93 per cent infected fruit, while those sprayed once shortly before the appearance of the disease and twice afterwards gave 16.84 per cent of fruit which was infected

with bitter rot, and the check trees which were not sprayed gave 44.94 per cent. The variety Huntsman, which is particularly susceptible to disease, was given a somewhat similar treatment. Trees sprayed 4 times before the appearance of the rot and twice afterwards yielded a crop 54.76 per cent of which was infected with the bitter rot. Trees sprayed twice after the rot appeared had 83.54 per cent of their fruit affected, while those not sprayed were attacked to the extent of 89.27 per cent.

In the other orchards the effect of treatment after the appearance of the disease was investigated. In one the trees of the Ben Davis variety sprayed 5 times after the disease had become fully established gave a crop 48.26 per cent of which was affected. Those which were sprayed 3 times after the disease was established were affected to the extent of 59.96 per cent, and the check trees 68.53 per cent. In the third orchard where Willow Twig trees were sprayed the percentage of infection was 57.82 per cent on trees sprayed 5 times after the disease appeared, 62.34 per cent on those sprayed 3 times after the appearance of the disease, and 63.81 per cent upon the nonsprayed trees.

From these experiments the conclusion is drawn that it is possible by the use of Bordeaux mixture to reduce the amount of bitter rot to less than 4 per cent in orchards where nearly 45 per cent of the fruit of unsprayed trees were affected. Applications should be made before the first appearance of the disease to be of the greatest value, although those made after the bitter rot had become established were not without some effect. The fruit should be well covered with the Bordeaux mixture and this can only be secured by several successive applications of the fungicide. The investigations for spraying are to be continued during the present year.

Apple canker, F. C. Sears (*Nova Scotia School Hort. Rpt. 1901–2, pp. 17–20, figs. 2*).—A description is given of apple-tree canker, and results of treatment for its prevention are shown. Based upon his investigations the author recommends the cutting out of the cankers and painting over the exposed surface with copper sulphate followed by some heavy paint.

Report of the laboratory of vegetable physiology and fermentations, H. Müller-Thurgau (*Jahresber. Vers. Stat. u. Schule, Wädensweil, 1899–1902, pp. 66–94*).—A report is given of investigations on frost injuries to fruit trees and grapes, the Monilia disease of stone fruit trees in which the twigs suffered severe injury, the browning or scorching of grape stock due to attacks of *Pseudopeziza tracheiphila*, testing wine ferments, on the fermentation of tannin-free pear must, and on the affections to which various wines are subject. Two papers by A. Osterwalder on the morphology of some species of Saccharomyces used in fermenting fruit wines and the formation of sulphureted hydrogen in fruit and grape wines are added.

Two diseases of vanilla, G. Delacroix (*Reprint from Bul. Soc. Mycol. France, 18 (1902), No. 3, pp. 14, figs. 2*).—A description is given of 2 fungus diseases of vanilla, the first of which has previously been attributed to *Calospora vanillæ* and the second to *Uromyces joffrini*. According to the author, the fungus causing the first disease is a form of *Glœosporium* or *Colletotrichum vanillæ*. It causes considerable injury to the vanilla plants, and for its prevention spraying with Bordeaux mixture or similar fungicide is recommended, care being taken to prevent the fungicide from coming in contact with the fruits. The second disease described produces a rust of vanilla and so far has not proved of any particular injury.

At the conclusion of this paper the author describes the development of *Glœosporium musarum*, a fungus which causes a blackening of the banana fruit.

The gooseberry mildew in Europe, E. S. Salmon (*Jour. Roy. Hort. Soc. [London], 27 (1902), pt. 2–3, pp. 596–601, fig. 1*).—A review is given of the occurrence and and distribution of the gooseberry mildew *Sphærotheca mors-uræ*. This disease seems to be widely spread throughout northern Europe and there is apparently evidence to show that the fungus is endemic in Russia and possibly elsewhere. Since the first report of the outbreak of this disease it has appeared in widely separated dis-

tricts and in every case assumed a serious character. A thorough spraying of the affected plants with potassium sulphid or Bordeaux mixture is recommended as a preventive treatment.

The distribution of the gooseberry mildew in Russia, P. Hennings (*Ztschr. Pflanzenkrank., 12 (1902), No. 5, pp. 278, 279*).—The presence of the gooseberry mildew (*Sphærotheca mors-uvæ*) in various parts of Russia is mentioned, and a number of new stations are added.

Chemical and physiological studies on the mulberry dwarf disease, U. Suzuki (*Ztschr. Pflanzenkrank., 12 (1902), Nos. 4, pp. 203–226; 5, pp. 258–278, pls. 2*).—This is essentially the same article as that previously noted from the bulletin of the College of Agriculture of the University of Tokyo (E. S. R., 13, pp. 61, 866).

Diseases of trees and plants, W. Carruthers (*Jour. Roy. Agr. Soc. England, 63 (1902), pp. 288–295, figs. 2*).—Notes are given on the Monilia disease of plums, the apple scab, the cherry fungus (*Gnomonia erythrostoma*), clover disease caused by *Sclerotinia trifoliorum*, black mold of currants (*Capnodium salicinum*), and Rhizoctonia disease of mangel-wurzels. Attention is called to the diseased condition of potato tubers which is due to attacks of *Chrysophlyctis endobiotica*. Attention is also called to a previous publication in which it was claimed that this disease was due to *Œdomyces leproides*. The two fungi are said to be identical and the previous name is the proper one to be used.

Æcidium elatinum as the cause of witches' brooms of the silver fir, E. Fischer (*Ztschr. Pflanzenkrank., 12 (1902), No. 4, pp. 193–202, pls. 2*).—In continuation of his previous investigations (E. S. R., 14, p. 162) the author reports additional notes on *Æcidium elatinum* as the cause of the witches' broom of the silver fir. Numerous inoculation experiments are reported upon in which the æcidio, uredo, and teleuto forms of the fungus were employed and the definite cause of the disease determined. The alternate generations of the fungus and their host plants are described.

The perithecial forms of Phleospora ulmi and Glœosporium nervisequum, H. Klebahn (*Ztschr. Pflanzenkrank., 12 (1902), No. 5, pp. 257, 258*).—It is claimed that the perithecial form of *Phleospora ulmi*, a common fungus on elm leaves, occurs on the leaves that winter over attached to the tree or sometimes detached, and this form has been described as *Mycosphærella ulmi*. The perithecial form of *Glœosporium nervisequum*, the cause of the leaf blight of sycamores and other trees, is said to be *Læstadia veneta*.

A disease of lilacs caused by Botrytis vulgaris, C. J. J. Van Hall (*Tijdschr. Plantenziekten, 8 (1902), pp. 142, 143, pl. 1*).—The author observed that the variety of lilac known as Madame Lemoine was affected by a disease caused by *Botrytis vulgaris*. No other variety of lilac was found similarly affected, although several nurseries were examined. The disease begins at the apex of the leaf and works back, drying up the leaf as it progresses. The dead portion of the leaf is marked with a series of rings showing that the disease proceeds irregularly rather than steadily. The reason for the special susceptibility of this variety is thought to be its sensitiveness to wet weather, of which there had been a great deal during the season, and that therefore the plants were not in condition to resist the attacks of the parasite.—H. M. Pieters.

Some pests of the flower garden, M. C. Cooke (*Jour. Roy. Hort. Soc. [London] 27 (1902), pt. 2–3, pp. 369–406, pls. 3, figs. 55*).—Descriptive notes, together with suggestions for prevention, are given of a large number of diseases of many of the common plants in the flower garden. The diseases are popularly described, the distribution of the fungus indicated, and sufficient technical descriptions given for the specific identification of the different species of fungi.

A disease of the carnation, M. C. Potter (*Jour. Roy. Hort. Soc. [London], (1902), pt. 2–3, pp. 428–430, figs. 3*).—A description is given of the leaf spot of carnations caused by *Septoria dianthi*. This disease has been under observation for

about 4 years, and the presence of the fungus in Great Britain has not hitherto been recorded. The fungus is described and the results of successful inoculation experiments are reported.

The treatment of fungus pests, A. Howard (*Imp. Dept. Agr. West Indies, Pamphlet No. 17, 1902, pp. 43, figs. 5*).—Brief popular descriptions are given of a number of the more common plant diseases known to occur within the West Indies, and suggestions made oi measures to be adopted to prevent their spread.

Annual review of the literature relating to plant diseases, 1901, M. Hollrung (*Jahresbericht über die Neuerungen und Leistungen auf dem Gebiete der Pflanzenkrankheiten. Berlin, 1903, pp. VIII+305*).—A review is given showing the progress that has been made in protecting useful plants against fungus, insect, and other depredations, and means for preventing loss from these agencies. The literature, which is quite voluminous, is for the most part grouped as in the previous reports (E. S. R., 12, p. 658; 14, p. 62), the classification being essentially the same. In the present number the author gives a short summary of the present status of knowledge regarding the various topics discussed, followed by abstracts of the more important contributions relating to them and a list of related papers, some of which are briefly abstracted. The new grouping of all the references to a single topic will be found a decided advance over the former arrangement, in which the important abstracts were separated from the briefer ones and those which were only mentioned by title.

ENTOMOLOGY.

Proceedings of the fifteenth annual meeting of the Association of Economic Entomologists (*U. S. Dept. Agr., Division of Entomology Bul. 40, n. ser., pp. 124, pls. 2, figs. 6*).—An account of this meeting, held in Washington, D. C., December 26 and 27, 1902, has been previously given (E. S. R., 14, pp. 535–538). In addition to the papers there noted, the following are included in the proceedings:

The lime-sulphur-salt mixture in Connecticut, W. E. Britton (p. 38).—This mixture proved to be as effective as any other remedy in the destruction of scale insects and did not injure trees in any case. It was also used in several large orchards with satisfactory results.

Development and hibernation of mosquitoes, H. A. Morgan and J. W. Dupree (pp. 88–92).—From these studies it is concluded that the 24 species of mosquitoes upon which notes were made can breed successfully in small pools. Most of the mosquitoes deposit their eggs singly upon the surface of the water. Water is believed not to be essential to the pupæ of some species so long as moist soil is accessible. The only 2 stages in which the mosquitoes were found hibernating were the egg and adult conditions.

Some insect inhabitants of the stems of Elymus canadensis, F. M. Webster (pp. 92, 93).—This species was much more extensively infested by insects, especially those of the genus Isosoma, than other related species of the same genus.

Some insect notes of the year, F. M. Webster (pp. 93–96).—A brief discussion of the Hessian fly, apple aphis, *Schizoceras zabriskei*, *Ceratomia catalpæ*, etc. It was observed that the red rust was more prevalent on wheat which had been attacked by the Hessian fly than on that which was not thus affected.

Mosquitocides, J. B. Smith (pp. 96–108).—Experiments were made to determine whether any insecticide substances could be mixed with water so as to prevent the development of mosquitoes. In these experiments the author tested permanganate of potash, Mosquitocide, salt, naphthaline, lime, copperas, crude petroleum, Phinotas oil, Phinotas disinfectant (5 per cent and 20 per cent), Phinotas Mark G, soluble blast furnace oil, Chloro-naphthalum, Puraline, Tarola, Milky Disinfectant, cretol, soluble creosote, Cresol (100 per cent), Phenol-septol, Synol Liquid, etc. These experiments indicate that there are several preparations which may serve as disinfect-

ants and larvicides, even when highly diluted. Good results were obtained from the use of Puraline and Phinotas oil.

Vernacular names of insects, E. W. Doran (pp. 108–111).—The author compiled a list of 3,500 compound vernacular names of insects and suggests certain rules to be observed in writing these compound words.

Notes on the larger sugar-beet leaf beetle, F. H. Chittenden (pp. 111–113).—*Monoxia punctcollis* was very injurious to sugar beets at Rocky Ford, Colo. Notes are given on the appearance, habits, and life history of this insect. For controlling the beetle the author recommends spraying with Paris green or arsenate of lead.

Some insects recently injurious to truck crops, F. H. Chittenden (pp. 113–120).—Biological and economic notes on the fall army worm, white grubs, leaf-footed plant bug, various species of blister beetle, *Scapteriscus didactylus*, *S. abbreviatus*, *Nysius minutus*, *Corizus hyalinus*, strawberry weevil, mealy bug on peanuts, *Elasmopalpus lignosellus*, etc.

Report of the entomologist, C. P. Gillette (*Colorado Sta. Rpt. 1902, pp. 103–126, pls. 6*).—During the season considerable loss was suffered from the attacks of grasshoppers, especially *Melanoplus differentialis*, *M. bivittatus*, and *M. femur-rubrum*. The author recommends plowing to destroy the eggs or the use of poisoned bran or hopper-dozers. About 400 tubes containing cultures of South African grasshopper fungus were distributed in various parts of the State and a few of the persons who used this fungus reported good results while a large number had no results. Experiments at the station with this fungus were an utter failure. No evidence was obtained to show that a single grasshopper had been killed by the fungus. In a few cases an investigation was made of localities where success had been reported and it was found that the grasshoppers were dying from another fungus (*Empusa grilli*).

Aspidiotus howardi is reported as injurious to pear and white-ash trees. Plant lice were unusually abundant, especially *Aphis pomi* and *A. viburni*. Sugar-beet leaf beetle (*Monoxia punctcollis*) destroyed about half of a 14-acre field of beets near Rocky Ford and also caused injury to beets at Ft. Collins. The beetles were found throughout the summer and the insect is double brooded. Paris green, London purple, and Paragrene gave good results when mixed with flour at the rate of 1:20. The native food of the insect consists of a number of plants which grow in alkali regions. The cherry slug was unusually abundant in the northern part of the State. Good results were obtained in combating this insect by spraying with Paris green, London purple, or Paragrene at the rate of 1 lb. to 160 gal. water, arsenate of lead at the rate of 1 lb. to 25 gal. water, white hellebore, 1 oz. to 3 gal. water, or by the use of pyrethrum or lime. Zenoleum used at the rate of 1 lb. to 50 gal. water killed the insects but injured the plants somewhat. Road dust was of little value.

Notes are given on the Western strawberry sawfly by S. A. Johnson. The species is described as new by A. D. MacGillivray, under the name *Emphytus gillettei*. The adult insect appears in May and early June and lays its eggs in the leaves. The larvæ hatch in a few days and live for a week or longer on the lower epidermis of the leaf. At the end of 4 to 6 weeks they become full grown and crawl into the ground to pupate. There is 1 brood annually. White hellebore is recommended as a remedy.

Tychea brevicornis is reported as injuring beets. In preventing the attacks of this insect the author recommends that the beets should not be planted in ground that was previously occupied with corn or salt grass. Considerable injury is reported as having been suffered by pine trees in Platte Canyon. *Pinus ponderosa* was attacked by a number of bark beetles, including *Tomicus calligraphus*, *T. integer*, *T. oregoni*, *Dendroctonus ponderosa*, *D. valens*, etc. The author recommends cutting and burning dead trees and the cutting for timber or fuel of such trees as show signs of weakening.

A list of bee plants is given showing the more important flowering plants fro

which bees gather honey in Colorado. Records kept showing the dates at which colonies of bees make their first gain in weight indicate that these dates correspond with the dates at which alfalfa begins to bloom. The dates varied from June 8 to 25.

Report of the State entomologist, A. L. QUAINTANCE (*Rpt. Maryland State Hort. Soc., 5 (1902), pp. 22–27, fig. 1*).—The author discusses the extent of orchard-inspection work done during the year and describes the method of procedure adopted in the case of infestation by San José scale. This insect was found in 1,280 localities in the State. The most satisfactory results in combating the San José scale were obtained from the use of lime-sulphur-salt wash applied just before the buds begun to swell in the spring. For summer treatment the author recommends kerosene emulsion.

Principal injurious insects of the year, A. L. QUAINTANCE and R. I. SMITH (*Rpt. Maryland State Hort. Soc., 5 (1902), pp. 99–110, figs. 11*).—Biological and economic notes on the strawberry weevil, flea beetles, imbricated snout beetle, onion maggot, squash ladybird, pear-tree slug, rose chafer, *Melanoplus bivittatus*, pea louse, and black peach aphis.

Report of the entomologist, C. FRENCH (*Jour. Dept. Agr. Victoria, 1 (1902), No. 8, pp. 793–800, pl. 1*).—Brief notes on the correspondence, publications, investigations, and experiments of the entomologist for the past season. Many additions have been made to the Museum of Economic Entomology and Ornithology and to the library. Notes are also given on the inspection of orchards, nurseries, and fruits, and a list is presented of the insects and fungi which are considered as dangerous under the Vegetation Diseases Act.

Annual report for 1902 of the zoologist, C. WARBURTON (*Jour. Roy. Agr. Soc. England, 63 (1902), pp. 296–307, figs. 2*).—The author discusses maggots in sheep, root-knot eelworm, oak tortrix, and black-currant gall mite. In preventing the attacks of the sheep botfly the author recommends the application to the sheep of some malodorous preparation, such as tar water. In the destruction of the root-knot eelworm considerable success was obtained from the use of carbolic acid applied at the rate of 33 oz. to 15 cu. ft. of soil. The use of remedies in the destruction of the black-currant gall mite was not attended with promising success. The author urges the desirability of securing uninfested plants at the start. Brief notes are also given on wireworms, *Eriophyes avellanæ*, and *Oribata orbicularis*.

Orchard and bush fruit pests and how to combat them, C. WARBURTON (*Jour. Roy. Agr. Soc. England, 63 (1902), pp. 115–134, figs. 12*).—Formulæ are given for the preparation of Paris green, arsenate of lead, kerosene emulsion, and quassia mixtures. Among the injurious insects noted by the author special mention is made of winter moth, cherry sawfly, red spider, apple-blossom weevil, codling moth, apple sawfly, pear midge, woolly aphis, oyster-shell bark louse, leopard moth, currant sawfly, currant borer, currant gall mite, raspberry beetle, etc. Notes are given on the habits, life history, and approved methods of combating these species of injurious insects.

Entomology, M. V. SLINGERLAND (*Proc. West. New York Hort. Soc. 1902, pp. 46–50, figs. 3*).—Notes on the palmer worm, cankerworm, Hessian fly, striped cucumber beetle, cherry fruit fly, and fall webworm. The author discusses the value of lantern traps. It is believed that injurious insects may be combated much more cheaply and effectively by other means than by lantern traps.

Insects injurious to fruit trees, H. FAES (*Chron. Agr. Canton Vaud, 15 (1902), No. 18, pp. 521–532, figs. 5*).—Notes are given on the habits, life history, and means of combating codling moth, *Balaninus nucum*, *Cheimatobia brumata*, and other less important species injurious to fruit trees.

Observations and experiments in combating animal pests on fruit trees, grapevines, and garden vegetables, HOFER (*Jahresber. Vers. Stat. u. Schule, Wädenswil, 1899–1902, pp. 108–121*).—The author discusses the injurious habits of

Diplosis pyrivora, *Cephus compressus*, *Lecanium cini*, and a number of species of gall mites. Experiments with mixtures containing soft soap showed that a 4 per cent solution was sufficient to kill the young lecanium. For destroying plant lice the author used a mixture containing soft soap, hard soap, and coal tar; also Nicotiana and mixtures containing soft soap and insect powder, and soft soap and quassia. A dilute tobacco decoction was also tested. All of these remedies proved very efficient in destroying the insects on the various fruit trees. In combating cabbage butterflies the author dusted flowers of sulphur, lime, and pulverized naphthaline on infested plants. Fluid sprays were used containing quassia, benzine, petroleum, tobacco extract, and a number of proprietary remedies. The dry insecticides had little effect while quassia, benzine, and petroleum gave excellent results.

San José scale investigations, IV, V. H. Lowe and P. J. Parrott (*New York State Sta. Bul. 228, pp. 389–446, pls. 7*).—The experiments reported in this bulletin were carried on in several localities in the State. No count of scales was made, since this method was considered inadequate as a check upon results. In laboratory experiments with infested apples, however, the scales were counted. As a rule the trees were sprayed once and then such portions as had been missed were later covered with the spray. A number of nozzles were used, the Seneca and Vermorel proving most satisfactory. An orchard of peach and plum trees on Long Island was sprayed March 25–29, the amount of mixture used averaging about 1½ gal. per tree. The weather following the application was rather wet. The buds of the peach trees were delayed about a week in opening, but at the time of the final examination these trees were in better condition than the control trees. A slight injury appeared in the fruit buds of the plum trees, but this was not permanent. The scales were nearly all destroyed. The wet weather had little effect on the spray, the mixture remaining upon the tree until May.

Another orchard of plum and peach trees in Columbia County was treated March 31–April 1, with the same general results. There were severe rains for 30 days after the application, but the killing effects of the wash were apparently not diminished. An orchard of pear trees in Columbia County was sprayed April 1 and 2, the weather conditions being the same as those just mentioned. The results were likewise satisfactory, the scales being nearly all destroyed and the wash remaining on the tree for about 2 months. Similar results were obtained from the treatment of another pear orchard in Columbia County with but 1 application and no respraying. An apple orchard in Ontario County was sprayed April 23–26, when many of the buds had already opened. Rainy weather followed for a period of 30 days. The foliage appeared to be considerably injured, but the trees recovered from the burning. The average yield of apples in this orchard had been 80 bu., while after treatment the yield was 275 bu. The same satisfactory results were obtained from the treatment of apple trees in the station orchard. An orchard of pear and peach trees in Niagara County was treated April 7–16. Frequent heavy showers occurred during April and May. The leaf buds were somewhat burned, but no permanent injury was caused. The spray remained on the trees 2 months and the results were highly satisfactory. In these experiments 710 trees were treated, with uniformly good results in the destruction of the scales without serious injury to the trees and with evidence that rainy weather does not diminish the effectiveness of the wash.

In the laboratory experiments the principal object was to determine whether the insecticidal property of the wash is due to the soluble ingredients or precipitates in the wash. The mixture was sprayed on a glass plate, and after being allowed to dry was subjected to a water spray from an atomizer. The solution thus obtained was applied to infested apples. A large percentage of the insects were killed by this solution. Solutions obtained within 72 hours after the application of the wash to the plate were more efficient than those obtained later. An experiment to determine the length of time during which the wash retains its insecticidal properties showed

that the solution obtained from the first application to the dried wash killed all the scales, while that obtained 6 days later killed only 10 to 13 per cent.

In testing the effect of an excessive amount of precipitates upon the scale the author found that the precipitates exercised a pronounced mechanical effect, while soluble ingredients killed the scales immediately. The authors found by experiments that the solution due to a falling of rain upon the wash upon the trees destroyed scales which had not been touched by the first application. The effect of the precipitates in the wash without the soluble ingredients was most marked on the young scales, while the adults were but little affected. In these experiments 50 apples were used, the number of scales varying from 1 adult and 11 young to 63 adults and 1,250 young on each apple. In the test of lime-sulphur compounds as a summer treatment, peach and pear trees were sprayed on June 14. The leaves were nearly all killed, but new leaves formed and a good crop was produced. The scales were all destroyed. Similar results were obtained in experiments with plum trees. It was found possible to produce a lime-sulphur wash without boiling, by slaking lime, adding sulphur in the form of a dust to the lime while slaking, and then adding caustic soda to the mixture. This insecticide promises to prove satisfactory.

The authors experimented with a number of other washes, including resin wash according to the California formula and the station formula, lime-water-kerosene wash, ammonia-casein wash, lime-sulphur-salt wash and casein, lime-sulphur-salt wash using the liquid only, lime-sulphur-salt wash and Bordeaux mixture, and potash-sulphur wash. Of all these mixtures the lime-sulphur-salt and Bordeaux mixture gave the best results, and this is of practical importance on account of its combining both insecticidal and fungicidal properties. This mixture was obtained by making lime-sulphur-salt wash in the usual way, to which 1 lb. copper sulphate was added to 11 gal. of the mixture. The authors conclude as a result of their experiments that no special apparatus is required for the application of the lime-sulphur-salt wash, that the wash does not readily spread, and hence should be applied carefully, that the application should be made a short time before the buds begin to swell, and that this wash is a highly effective and safe treatment for trees infested with San José scale.

Spraying for the San José scale with the lime-sulphur-salt and other washes, F. H. Hall, V. H. Lowe, and P. J. Parrott (*New York State Sta. Bul. 228, popular ed., pp. 8*).—A popular summary of the above bulletin.

Orchard treatment for the San José scale, H. T. Fernald (*Massachusetts Sta. Bul. 86, pp. 15*).—In the fall of 1901 the station orchard was found to be badly infested with San José scale. The orchard consisted of apple, pear, cherry, peach, plum, prune, and quince trees, numbering 612 in all. On the following March 27 treatment was begun and was continued until April 14. No injurious effects to the trees were produced by any of the different methods of treatment. The method of determining results consisted in inspecting the trees as soon as the first young larvæ appeared, June 23, followed by a reinspection every week or two during the summer and fall. A potash-whale-oil soap, used at the rate of 2 lbs. to a gallon of water, freed only 28.12 per cent of the trees from the scale. Another potash-whale-oil soap gave better results, freeing 52.6 per cent from the scale. A whale-oil-tobacco soap was perfectly effective in 53.8 per cent of cases, while the following percentages of effectiveness were obtained by the other insecticides: Insect soap, 40.7 per cent; agricultural soap, 33⅓ per cent; crude petroleum in a 30 per cent mixture with water, 43.2 per cent; kerosene in a 36 per cent mixture with water, 44.4 per cent; lime-sulphur-salt wash, 65.6 per cent. The relative cost of materials per tree was as follows: Fumigation, 8 cts.; potash-whale-oil soap, 8 cts.; potash-whale-oil-tobacco soap, 9 cts.; agricultural soap, 4 cts.; crude petroleum, 4 cts.; kerosene, 4½ cts.; lime-sulphur-salt wash, 5 cts.; insect soap, 12 cts. A few badly infested trees were sprayed July 2 with 10 per cent kerosene, and good results were obtained. A major-

ity of the young scales were destroyed without injury to the trees. The author concludes from his experiments that the best method of treatment of orchard trees, where they are small, is by fumigation, while lime-sulphur-salt wash is the most satisfactory and effective spraying material.

San José scale, E. D. SANDERSON (*Delaware Sta. Bul. 58, pp. 16, pls. 4*).—This insect is described and notes are given on its origin, life history, means of distribution, and food plants. The remedies suggested by the author are cutting and pruning badly infested trees and treating other trees with kerosene emulsion, mechanical mixtures of kerosene or crude petroleum with water, whale-oil soap, and lime-sulphur-salt wash. Plum and pears treated with a mixture of crude petroleum containing 20 to 25 per cent of oil killed the scales without injuring the leaves. Fumigation with hydrocyanic gas is recommended as the most satisfactory treatment for small and medium sized trees.

Canadian experience in the use of lime, sulphur, and salt for San José scale, G. E. FISHER (*Proc. West. New York Hort. Soc. 1902, pp. 134–137, figs. 2*).—Brief notes are given on the use of crude petroleum, kerosene, and kerosene emulsion in the destruction of San José scale, together with an account of the use and value of the lime-sulphur-salt wash for this purpose. The latter remedy was found to be very satisfactory and is recommended as being perfectly effective and safe, even when applied by ordinary farm workmen.

Notes on lime-sulphur-salt wash as an insecticide, C. W. MALLY (*Ent. News 13 (1902), No. 7, pp. 223–230*).—The author's experiments with this insecticide in combating *Diaspis pentagona* in Cape Colony is briefly related. Various formulæ were used, in which the amount of lime was varied and in some of which the sulphur and in others the salt and sulphur were omitted. From the author's experiments it is concluded that none of these formulæ is very efficient under South African conditions in the destruction of *D. pentagona* in the adult condition. The young larvæ are destroyed for a period of 3 months after the application. Frequent rains seem to have a favorable action upon the effectiveness of the insecticide.

Insect enemies of the apple tree and its fruit, L. BRUNER (*Trans. Amer. Appl. Growers' Cong., 1902, pp. 100–106*).—Notes on the extent of insect injuries to apple throughout the country, together with a brief account of general remedies to be applied in controlling these insects and an analytical key for use in determining the various species.

Tent caterpillars, W. N. HUTT (*Utah State Farmers' Inst. Rpt. 1902, pp. 70–74, fig. 1*).—The tent caterpillar is reported as causing great injury to the terminal branches of fruit trees. Notes are given on the habits, life history, and remedies for this species.

A study of the parasites of the American tent caterpillar, W. F. FISKE (*New Hampshire Sta. Tech. Bul. 6, pp. 181–230, figs. 7*).—The author made continued observations on the parasites of the American tent caterpillar for a period of 4 years. It is estimated that the average number of caterpillars destroyed by parasites annually varies from 15 to 20 per cent. In 1900 it was 17.4 per cent. A table is given showing the comparative seasonal abundance of the 11 primary parasites of the tent caterpillar which were studied by the author. The primary parasites are as follows: *Pimpla conquisitor*, *P. inquisitor*, *P. pedalis*, *Limneria fugitiva*, a species of Anomalon, *Ameloctonus clisiocampæ*, *Cryptus extrematus*, *Rhogas intermedius*, *Bracon gelechiæ*, *Diglochis omnivorus*, and *Apanteles clisiocampæ*. The latter species and Ameloctonus are described as new. A number of the primary parasites serve in turn as hosts to secondary parasites, or sometimes become themselves secondary parasites. Notes are given on a number of the more important secondary and tertiary parasites.

Grapevine-root worm, E. P. FELT (*New York State Mus. Bul. 59, 1902, pp. 20–8, pls. 6*).—An outbreak of this insect occurred in Chautauqua Co., N. Y., in the neighborhood of Ripley, where about 80 acres of grapes were destroyed. The infested

area is described and notes are given on signs by which the presence of the insect may be known, and on the present conditions of infestation by this insect in the Ohio grape belt. The species is described in its different stages and notes are given on its life history. The number of eggs laid by female beetles varied between 106 and 184. The duration of the egg stage, as determined by the author, was from 9 to 12 days. Experiments were devised for the purpose of testing the burrowing power of the larvæ. A glass tube ½ in. in diameter and 17 in. in length was bent so that 4 in. were vertical, and filled with loose earth. Grubs placed on the surface of the soil in the vertical part of the tube made their way down into the soil and through the whole length of the tube within a few days. One grub made its way through 7½ in. of tightly packed soil within 6 days. It was found that the larvæ were able to exist for a considerable time without food. The insect feeds chiefly on grapes, but is also known to attack the Virginia creeper and occasionally other plants. A number of experiments were made in testing remedies for controlling this insect, and as a result of these experiments it is recommended that the soil be thoroughly stirred between the rows and near to the vines, so that the insects may be exposed in their pupal condition. The beetles may be collected by special catchers so constructed that they may be operated rapidly, and these remedies may be supplemented by thorough spraying, preferably with arsenate of lead. It appears that no one method can be entirely relied upon to control the insect. A brief bibliography of the species since 1866 is also given.

Some diseases of the potato and of fruit trees, A. Linton (*Jour. Khediv. Agr. Soc. and School Agr., 4 (1902), No. 5, pp. 197–208, pls. 4*).—Brief notes on the biology of insects, with a special account of the habits and life history of leopard moth, plum-stem borer, and a number of scale insects, together with a brief discussion of peach-leaf curl.

Sugar-cane borers—insecticides and fungicides, P. Bonâme (*Sta. Agron. Mauritius, Bul. No. 7, 1902, pp. 28*).—The common sugar-cane borer of Mauritius is not *Diatræa saccharalis*, but *Sesamia nonagrioides*. Notes are given on the habits and life history of this species, a translation of a note on the sugar-cane borer by H. Maxwell-Lefroy is presented, and a brief discussion is given of the formulæ and method of applying common insecticides and fungicides.

Cabbage-root maggots, G. H. Carpenter (*Jour. Dept. Agr. and Tech. Instr. Ireland, 3 (1902), No. 1, pp. 109–113, pl. 1*).—Biological and economic notes on *Phorbia brassicæ*. The species is reported as having occurred in unusual numbers during the year 1901. In combating this insect it is recommended that close attention be given to the plants in order to determine the egg-laying period, and that eggs should be destroyed at once. A dressing of gas lime has been found useful in keeping off the flies. The use of tarred cards around the stem of young plants may be relied upon to some extent in preventing the deposition of the eggs. Brief notes are given on the natural enemies of this insect.

Australian ladybird beetles, W. W. Froggatt (*Agr. Gaz. New South Wales, 13 (1902), No. 9, pp. 895–911, pl. 1*).—Notes are given on the habits and life history of a number of species of Coccidæ belonging to the genera Epilachna, Coccinella, Callineda, Verania, Leis, Orcus, Novius, Rhizobius, Cryptolæmus, and Scymnus. A short bibliography of works relating to Australian Coccidæ is appended to the article.

The flea beetles—their life history, economical importance, and remedies against them, A. C. Jensen (*Tidsskr. Landökon., 21 (1902), No. 6, pp. 379–393*).

Screw worms in St. Lucia, St. G. Gray (*British Med. Jour., 1903, No. 2204, pp. 724, 725*).—Descriptive biological and economic notes are given on this insect. The author briefly discusses the distribution of this species and the nature of its attacks upon man and animals.

New Geometridæ and microlepidoptera from the European faunal region, A. Fuchs (*Stettin. Ent. Ztg., 63 (1902), No. 1, pp. 315–330*).—Descriptive and eco-

nomic notes on *Crambus pascuellus*, *Tortrix corylana*, *Gelechia caminariella*, and related species.

Hymenoptera of Valais, E. Frey-Gessner (*Bul. Murithienne, Soc. Valais. Sci. Nat., 1902, No. 31, pp. 21–80*).—A monographic account of the genus Halictus. A brief bibliography relating to this genus is compiled by the author and analytical keys are presented for the determination of the males and females belonging to the various species, some of which are described as new.

On the Hymenoptera collected by Mr. Robert Shelford at Sarawak, and on the Hymenoptera of the Sarawak Museum, P. Cameron (*Jour. Straits Branch Roy. Asiatic Soc., 1902, No. 37, pp. 29–140*).—Descriptive and biological notes on a large number of species of sawflies, Ichneumonidæ, Mutillidæ, and other families of Hymenoptera. Many of the species are described as new.

The wharf borer (Nacerdes melanura), T. Broun (*New Zealand Dept. Agr. Rpt. 1902, pp. 460–463, pl. 1*).—This insect was found in large numbers in wooden blocks used for paving purposes. The upper surface of the blocks had been asphalted and were not injured to the same extent as the lower portions. The insect is described in its various stages.

Parasites of Oiketicus platensis, C. Schrottky (*An. Mus. Nac. Buenos Aires, 8 (1902), No. 1, pp. 45–48*).—In addition to *Smicra bergi*, which was already known as a parasite of this insect, the author reports 2 other parasites, *Pimpla brasiliensis* and *P. tricolor*.

Metamorphoses of Uroplata costipennis, J. Bréthes (*An. Mus. Nac. Buenos Aires, 8 (1902), No. 1, pp. 13–17, figs. 9*).—This insect lays its eggs on the under side of the leaves of *Sida rhombifolia*. Descriptive and biological notes are given on the insect in its various stages.

Contribution to a knowledge of the Rutelidæ, F. Ohaus (*Stettin. Ent. Ztg., 63 (1902), No. 1, pp. 1–57, figs. 10*).—Notes are given on the habits and life history of a number of species of Anomala and related genera. Descriptions are given of all these species, some of which are new.

On some parasites of Xylocopa tenuiscapa, E. E. Green (*Ent. Mo. Mag., 2. ser., 8 (1902), No. 154, pp. 232, 233, fig. 1*).—In trees tunneled by this insect the author found numerous specimens of *Cissites debeyi* in all stages. It is suggested that these beetles may be carried from one nest to another attached to the legs of their host. A parasitic mite (*Greenia parkinsi*) was also found associated with the bees.

Nursery inspection, C. M. Weed (*New Hampshire State Bd. Agr. Circs. 1–3, 1903, folios*).—The text is given of the recent New Hampshire law authorizing the State board of agriculture to appoint a State nursery inspector and to provide for the protection of trees and shrubs from injurious insects and diseases. The attention of the public, nurserymen, tree agents, and express and freight agents is called to the nature and provisions of this law.

The effects of drought upon insect life, Mary E. Murtfeldt (*Trans. Amer. Apple Growers' Cong. 1902, pp. 119–121*).—On account of the unusual drought in the Mississippi Valley in 1901 the hope was entertained that injurious insects would be unfavorably affected thereby. These expectations, however, were not realized, since the common noxious insects were present during the following season in as large numbers as usual.

Lantern trapping, E. J. Smith (*Ent. News, 13 (1902), No. 7, pp. 207–209*).—A description is given of a lantern which is said to have proved very efficient in capturing moths for museum specimens. With regard to the economic value of the trap the author believes that the device is worse than useless, the number of injurious insects captured being very few.

Spray calendar (*Oregon Bd. Hort. Rpt. 1902, pp. 70–90*).—Formulæ are given for the preparation of approved insecticides and fungicides, together with brief directions for the application of these remedies in combating common insect and fungus pests.

Insecticides and fungicides, A. B. Cordley (*Oregon Sta. Bul. 75, pp. 21–43*).—The nature of insecticides and fungicides is briefly discussed and notes are given on the methods of preparation and application of the better known substances of these classes. A brief list of plants is given in alphabetical order, with notes on some of the more important insect and fungus diseases to which they are subjected and recommendations regarding means of controlling these pests.

Paris green, W. C. Stubbs (*Louisiana Stas. Bul. 73, 2. ser., pp. 174–176, 190, 191*).—The results of examinations of 71 samples under the provision of the State law are reported.

Contribution to the knowledge of Anopheles, W. Dönitz (*Ztschr. Hyg. u. Infectionskrank., 41 (1902), No. 1, pp. 15–88, pls. 2*).—Detailed biological descriptive and economical notes are given on a number of species of Anopheles collected from various tropical localities.

The structure and biology of Anopheles maculipennis, G. H. F. Nuttall and A. E. Shipley (*Jour. Hyg. [Cambridge], 2 (1902), No. 1, pp. 58–84*).—Notes on the resting position of the adult, the geographical distribution of the species, habitat, modes of dissemination, migration, hibernation, longevity, egg laying, number of generations, food, and influence of heat, cold, light, color, and sound upon the mosquitoes. A brief bibliography of related literature is appended to the article.

Characters of some mosquito larvæ, J. B. Smith (*Ent. News, 13 (1902), No. 10, pp. 299–303, pl. 1*).—Extensive collections of mosquitoes were made for the purpose of studying the anatomy and habits of the larvæ. Notes are given on the characters and habits of the larvæ of a number of species.

Notes on the early stages of Culex canadensis, J. B. Smith (*Ent. News, 13 (1902), No. 9, pp. 267–273*).—This species is said to be a common one in moist woodlands of New Jersey. Brief notes are given on the habits of the larvæ, which is said to prefer woodland springs and pools or ditches carrying spring water. The author never observed the larvæ in stagnant open water. A detailed description is given of the larvæ of this species.

Selecting the locality for an apiary, R. Beuhne (*Jour. Dept. Agr. Victoria, 1 (1902), No. 9, pp. 908, 909*).—Attention is called to the effect of locality, and especially of the honey plants upon the color and other characters of the honey obtained. The author enumerates a number of plants which are valuable in the production of honey. Bee raisers are advised to locate their apiaries near red gum, yellow box, and gray box.

A scent-producing organ in the abdomen of the worker of Apis mellifica, F. W. L. Sladen (*Ent. Mo. Mag., 2. ser., 8 (1902), No. 153, pp. 208–211, fig. 1*).—In studying the phenomenon of humming in bees the author was led to investigate an abdominal organ in workers which was described by Nassanoff in 1883. It was found that this organ was capable of emitting a peculiar odor which may be of use to the bees in signaling to one another.

FOODS—NUTRITION.

Experiments on the metabolism of nitrogen in man, E. Landergren (*Skand. Arch. Physiol., 14 (1903), No. 1–3, pp. 112–175, pl. 1*).—Experiments with man are reported which were made with the special object of learning the minimum amount of protein required. In general the diet contained a limited amount of protein with an abundance of carbohydrates, or fat or both, to supply energy, while in one case the subjects fasted.

When a limited amount of protein was supplied under the experimental conditions the body reached after a few days a condition when apparently not more than 3 or 4 gm. of nitrogen was metabolized per day. Provided a minimum quantity of carbohydrates is present, the amount not being definitely known, the author regards it

probable that fat protects protein as well as an isodynamic quantity of carbohydrates, both in a condition of nitrogen hunger and nitrogen abundance. It was noted that under certain conditions fat exhibited less than one-half its protective power when carbohydrates were absent. This the author believes is explained by the fact that when carbohydrates are no longer supplied some must be formed in the body from protein, and that fat can not serve for this purpose in the place of protein. In other words, as soon as the glycogen is no longer present in the body fat is inferior to carbohydrates as a protector of protein.

This question and related topics, including the cleavage of protein during fasting, are discussed at length with special reference to the author's results and those obtained by other investigators.

Concerning the metabolism of phosphorus in adult man, R. Ehrström (*Skand. Arch. Physiol., 14 (1903), No. 1–3, pp. 82–111, figs. 2*).—The author's experiments were made with 3 men, and the foods and excretory products were analyzed. The excretion of nitrogen and of phosphorus were not found to be parallel, the quantity of nitrogen being influenced by the protein content of the body and the quantity of phosphorus by the quantities of phosphates dissolved in body fluids, the amount in the skeleton, and also by the amount of lecithin and protein containing phosphorus.

The author concludes, therefore, that it is not necessary in metabolism experiments to calculate the ratio of nitrogen to phosphorus. As regards the metabolism of this element, the author notes that the amount of phosphorus present in food is one of the factors which affects the amount metabolized. The body has not the same tendency to accumulate phosphorus and reach a condition of equilibrium as is observed with nitrogen. Within limits at least, the metabolism of phosphorus is thought to be regulated in the same way as that of fat. That is, it can be stored up in the body or drawn upon, according to circumstances, for comparatively long periods. Further experiments on this point are regarded as essential. Apparently there is a minimum phosphorus requirement which varies within rather narrow limits, 1 to 2 gm. per day, supplied by an ordinary mixed diet, being, in the author's opinion, about the needed quantity.

The amount of phosphorus digested, the form in which it is best fitted for resorption in the body, the form in which phosphorus occurs in urine, the metabolism of nitrogen, and other topics are discussed.

The effect of different variables upon the excretion of carbon dioxid during positive muscular work, J. E. Johansson and G. Koraen (*Skand. Arch. Physiol., 14 (1903), No. 1–3, pp. 60–81, dgm. 1*).—Continuing earlier work (E. S. R., 14, p. 992) experiments in which the respiratory quotient was determined are reported on the effects of training, duration of work, speed at which it is performed, and some similar factors upon positive muscular work, which consisted in raising and lowering a weight with the aid of apparatus of special construction. The authors conclude that in harmony with earlier observations the carbon dioxid excretion is directly proportional, within certain limits determined by practice or training, to the number of muscular contractions. It also appeared that with positive muscular work the carbon dioxid excretion was dependent upon the manner and duration of the muscular motion as well as the amount of external work produced. The effect of duration is greater in so far as it represents the duration of the muscular contractions in successive phases of motion. The experimental data are further discussed at some length.

The artificial method for determining the ease and rapidity of the digestion of meats, H. S. Grindley and T. Mojonnier (*Univ. Illinois, Univ. Studies, 1 (1903), No. 5, pp. 3–20*).—The results of a considerable number of digestion experiments with raw and cooked beef are reported and the experimental methods described. According to the authors the results indicate that there is a difference in the ease and rapidity

of digestion of the protein of raw meat and meat cooked by the common methods, the difference being most noticeable in the results of experiments in which the samples were digested with pepsin solution for 1 hour.

The data presented are not regarded as sufficient for final deductions, but, according to the authors, "it does seem that the protein of raw meat is more readily soluble or digestible than the protein of cooked meats. The experiments also indicate that the protein of meat cooked by boiling is more readily digestible than the protein of broiled or fried meats. The protein of fried meats is less rapidly soluble or digestible than broiled meat. These same differences are also noticeable in the results obtained after continuing the digestion for 2 hours, but after longer digestion these differences mostly disappear and after digesting with pepsin solution for 24 hours the digestibility of raw and cooked meats seems to be practically the same. Further, the results here reported show that the method of artificial digestion [as modified by the authors] gives a ready means of determining the relative ease and the rapidity of the digestion of the protein of foods."

In some of the experiments formalin was added after digestion had continued for a definite time and the material allowed to stand 24 hours before filtering. It is believed that the results indicate that formalin can be thus used for stopping the action of pepsin solution, but it is planned to investigate the subject further and test phenol and other substances also.

Calorimetric examinations of milk, A. Schlossmann (*Ztschr. Physiol. Chem., 37 (1903), No. 4, pp. 337–349*).—The author reports determinations of the heat of combustion of a number of samples of human milk, as well as that of the cow, goat, and ass, and concludes that this value may be calculated accurately with the aid of factors.

The technique of calorimetric analytical methods, A. Schlossmann (*Ztschr. Physiol. Chem., 37 (1903), No. 4, pp. 324–336*).—The method of determining heat of combustion with a Hemple bomb calorimeter is described and discussed.

Infant feeding (*Maine State Bd. Health Rpt. 1900–1901, pp. 181–280, figs. 3*).—Infant feeding, modified milk, and related topics are discussed, as well as the management of dairies in connection with the production of milk for the artificial feeding of infants.

The value of macaroni wheat for bread making, E. C. Chilcott (*South Dakota Sta. Bul. 77, pp. 29–38, figs. 4*).—The fact that macaroni wheats can be satisfactorily used for bread making is pointed out, and directions for its successful use and recipes by Alice D. Feuling are given. It is stated that the yeast fermentation proceeds more rapidly with macaroni wheat flour than with ordinary flour, that is, that the bread is raised more quickly.

The chemical and milling properties of macaroni wheat, J. H. Shepard (*South Dakota Sta. Bul. 77, pp. 39–42*).—A test made with a roller mill of a size suited for laboratory experimenting showed, according to the author, that macaroni wheat offered no special difficulties in milling, although the grains are "harder and require more power for their reduction than the ordinary bread wheats."

Modifying the milling processes slightly a sample of Kubanka macaroni wheat gave 6.38 per cent bran, 20.83 per cent shorts, and 71.54 per cent flour. The bran contained 16.3 per cent protein, the shorts 17.4 per cent, and the flour 16.9 per cent. The flour gave, according to the author, 54.8 per cent of wet gluten and 18 per cent dry gluten. "The difference between the wet and dry gluten shows the water-holding power of the macaroni flour to be all that could be desired." Data are also reported regarding the protein content of a number of samples of wheat which seem to show that the local-grown macaroni wheat contains more protein than the original seed.

Impurities in American wheat, A. L. Winton (*Ztschr. Untersuch. Nahr. u. Genussmtl., 6 (1903), No. 10, pp. 432–447, figs. 16*).—The principal weed seeds which

are found in wheat are described with special reference to their identification by microscropical methods.

Concerning the composition and digestibility of several sorts of Norwegian flat bread, S. Torup and P. W. K. Böckmann (*Arch. Math. og Naturvidensk., 24 (1901), abs. in Centbl. Agr. Chem., 32 (1903), No. 4, pp. 235–240*).—The digestibility of a kind of unfermented bread called "flat bread," made from oats and from barley, was studied in experiments with man, the income and outgo of nitrogen being also determined. The average digestibility of the oat bread with butter was: Dry matter 76.0 per cent, protein 63.7, fat 95, nitrogen-free extract 82.2, crude fiber 6.7, soluble ash 31.8, and insoluble ash 0.05 per cent. The average digestibility of the barley bread and butter was: Dry matter 86.1 per cent, protein 77.8, fat 95.3, nitrogen-free extract 91.3, crude fiber 6.6, soluble ash 51.5, and insoluble ash 0.3 per cent.

According to the authors, the Norwegian hard flat bread made without ferments is as well digested by healthy men as fermented bread. The crude fiber (from the hull) hinders markedly the digestibility of protein and carbohydrates. On the other hand, the digestibility of the fat of the butter eaten with the bread was little, if at all, affected. A considerable amount of the material ordinarily estimated as crude fiber was digested.

Aids to bread baking, O. von Czadek (*Ztschr. Landw. Versuchsw. Oesterr., 6 (1903), No. 2, pp. 195, 196*).—Analyses are reported of commercial products which are said to increase the activity of yeast.

The baker's book, E. Braun (*New York: Author, Vol. I, pp. 306, pls. 9, figs. 99*).—This publication, which contains information of use to bakers and those interested in this trade, includes a number of descriptive, historical, and miscellaneous articles on bread and bread making, and other data, gathered from a variety of sources.

Chemical composition of cooked vegetable foods, Katharine I. Williams (*Proc. Chem. Soc. [London], 19 (1903), No. 262, p. 66*).—The vegetable foods analyzed include raw and cooked broccoli, Brussels sprouts, dried peas, oatmeal, and macaroni.

Asphodelus tenuifolius, an Indian famine food, A. Ghose (*Agr. Ledger, 1902, No. 7 (Veg. Prod. ser., No. 72), pp. 155–157*).—The plants and seeds of *Asphodelus tenuifolius* are eaten in India in times of need. As shown by a chemical analysis, the seed contains fairly large amounts of protein, fat, and carbohydrates. Extracts from the seed were tested for alkaloids, but none was found. A test with iodine failed to indicate the presence of starch, nor was sugar detected. The seed contained about 25 per cent fat, the properties of which were studied to some extent.

The examination and utilization of horse-chestnuts, Laves (*Oesterr. Chem. Ztg., 5 (1902), No. 22, pp. 511, 512*).—In a paper presented before a meeting of the German Naturalists and Physicians attention is called to the food value of horse chestnuts which have been treated with alcohol to remove the glucosid and bitter material present.

Concerning sulphured dried fruit, A. Beythien and P. Bohrisch (*Ztschr. Untersuch. Nahr. u. Genussmtl., 6 (1903), No. 8, pp. 356–360*).—Experimental data are reported regarding the occurrence of sulphurous acid in dried fruits, the subject being discussed from a hygienic standpoint.

Coffee substitutes (*Agr. News [Barbados], 2 (1903), No. 28, p. 148*).—A brief note on the use of gumbo seed (*Abelmoschus*, or *Hibiscus, esculentus*) as a substitute for coffee.

Pineapple wine, A. Salles (*Rev. Agr. [São Paulo], 8 (1902), No. 18, pp. 14–17*).—The manufacture of wine from pineapples is described and discussed.

Pineapple wine, H. Neuville (*Jour. Agr. Trop., 3 (1903), No. 21, pp. 70–74*).—A critical discussion of the production of pineapple wine based on the article referred to above.

Food adulteration in Wyoming, E. E. Slosson (*Wyoming Sta. Bul. 56, pp. 44*).—

The text of the Wyoming pure food law is quoted, existing conditions discussed, and the results of a number of examinations, which were made in carrying out the provisions of the law, are reported.

Report on the examination of foods, drugs, and public water supplies, R. O. Brooks (*Trenton: Edwin Fitzgeorge, 1903, pp. 30*).—The results of the examinations made at the chemical department of the New Jersey State Laboratory of Hygiene of samples of chocolate, cocoa, coffee, flavoring extracts, honey, milk, maple and other sirups, molasses, olive oil, spices and condiments, drugs, mineral waters, potable waters, etc., are reported. A number of samples of meat and meat products, butter, and grape juice were examined for added preservatives. None were found in the butter, grape juice, and mince-meat examined. Boric acid was found in 1 sample of sausage meat, 2 of Hamburger steak, and 1 of potted ham.

National association of State dairy and food departments (*Jour. Proc. Sixth Ann. Conv. Nat. Assoc. State Dairy and Food Depts., pp. 504*).—This volume includes the proceedings of the sixth annual convention of the National Association of the State Dairy and Food Departments held at Portland, Oreg., and a summary of the State pure food laws, court decisions, etc. The volume was compiled by H. B. Meyers.

The household food supply of the United Kingdom, R. E. Turnbull (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 197–211*).—A statistical article.

Relations of population and food products in the United States, J. H. Blodgett (*U. S. Dept. Agr., Division of Statistics Bul. 24, pp. 86*).—A statistical article treating of the most important food products based largely, according to the author, upon the Census reports from 1850 to 1900. Some of the causes of the increase or decline observed in the production or use of different materials are discussed as well as other general matters.

The food factor in education (*British Med. Jour., 1903, No. 2205, pp. 797–800*).—A discussion of the character of the diet furnished in schools in England and the importance of adequate food for young and growing students. A number of examples of school diets are given.

Text-book of hygiene, M. Rubner (*Lehrbuch der Hygiene. Leipzig and Vienna: Franz Deuticke, 1903, 7. ed., pp. XII + 982, figs. 295*).—In the new edition of this important work the author states that new material has been added, especially the results of investigations carried on since the last edition. The volume, which is designed for the use of students of medicine, physicians, sanitary officials, etc., contains chapters on food and condiments in addition to the other topics usually treated of under the general subject of hygiene.

ANIMAL PRODUCTION.

Variation in animals and plants, H. M. Vernon (*New York: Henry Holt & Co., 1903, pp. IX + 415, figs. 30*).—The 3 general subjects discussed in this volume are the facts of variation, the causes of variation, and the relation of variation to evolution. The following topics serve as titles to chapters under this threefold division of the book, viz.: Measurements of variation; dimorphism and discontinuous variation; correlated variations; blastogenic variations; laws of variation; effects of temperature, light, moisture, salinity, food, products of metabolism, and general conditions of life on variation; action of natural selection on variations; and adaptive variations.

The variation of animals is treated at greater length than that of plants. The author states that the keynote of much of the recent work on variation is the recognition of the fact that all problems in this field, in order to be studied effectively or be solved in a satisfactory manner, must be formulated in mathematical terms. It is no longer considered sufficient merely to state that a certain variation occurs to

a greater or less degree; it is necessary to state the exact amount of variation so fa as it can be measured, and the proportion of cases in which it occurs, in order t make it possible to determine the degree of importance of any variation in th development of the species.

The author critically discusses the recent work of Bateson, de Vries, Poulton Weldon, Vines, and many other writers, including the theory of variation propose by Mendel.

Practical manual of animal feeding, R. Dumont (*Manuel pratique de l'alimenta tion du bétail. Paris: J. B. Baillière & Son, 1903, pp. 360*).—This volume, which i one of the Bibliothéque des Connaissances Utiles, includes the general principles animal feeding, feeding stuffs and their digestibility, and the practical feeding farm animals, a number of tables of the composition of feeding stuffs, etc., bein appended.

The inspection of feeding stuffs in 1902, F. W. Morse (*New Hampshire St Bul. 98, pp. 15–23*).—In carrying out the provisions of the State feeding stuff law which is quoted, analyses were made of 57 samples of cotton-seed meal, linseed mea gluten meals and feeds, hominy meal, commercial feeds, and cereal breakfast foo by-products, poultry feeds, meat and bone meals, and calf meal. According to th author, the results of the analyses showed a satisfactory condition as regards qualit since "there are but few serious deficits in the goods as guaranteed."

Using vine prunings and grape marc with molasses for making molasse feeds, L. Grandeau (*Jour. Agr. Prat., n. ser., 5 (1903), No. 9, pp. 277, 278*).—Da are quoted regarding the nutritive value of vine prunings and grape marc, which le to the deduction that such materials combined with molasses would make satisfa tory feeding stuffs.

Industrial by-products used in the manufacture of molasses feeds, Grandeau (*Jour. Agr. Prat., n. ser., 5 (1903), No. 1, pp. 9–11*).—This article is base on experiments reported by O. Kellner. (See below.)

Preparation and use of molasses bread for cattle feeding, G. Malet (*Z Zuckerrübenbau, 9 (1902), No. 19, pp. 295–299*).—Molasses bread for horses and f cows is described and the composition of the 2 sorts quoted. An experiment is al reported which, according to the author, shows that molasses bread to the amount 3 kg. may form a part of the ration of horses. With cows it was found that molass bread caused gains in weight but exercised no influence upon the quality or quanti of the milk. It is also stated that it facilitated and hastened the fattening of pigs.

The keeping qualities of certain peat-meal-molasses feeds, A. Herzfel O. Schrefeld, and K. Stiepel (*Ztschr. Ver. Deut. Zuckerind., 52 (1902), No. 55 p. 207; abs. in Centbl. Agr. Chem., 32 (1903), No. 4, pp. 252–256*).—Experiment data are reported and discussed.

Experiments on the digestibility of a number of materials used as absor ents in molasses feeds, O. Kellner et al (*Deut. Landw. Presse, 29 (1902), No. 1 p. 832; abs. in Centbl. Agr. Chem., 32 (1903), No. 4, pp. 233–235*).—In experimen with sheep the digestibility of mowrah meal, coffee hulls, peanut shells, and coc hulls was studied.

The protein of ground whale flesh, A. Kayli (*Norsk Landmandsblad, 21 (190 pp. 281, 282; abs. in Centbl. Agr. Chem., 32 (1903), No. 2, pp. 120–122*).—The auth has reported an extended study of the composition of the nitrogenous constituents ground whale flesh, a concentrated feed extensively used in Norway, especially milch cows.

The energy of growth and the lecithin in decoctions of cereals, M. Sering (*L'énergie de croissance et les lécithines dans les décoctions de céréales. Paris: Masson Co., pp. 170*).—The author believes that lecithin plays an important part in t growth of animals, and in this volume, which is one of the series Encyclopédie S entifique des Aide-Mémoire, he has gathered together the results of numerous inv

tigations which have a bearing upon this subject, the material being critically discussed. The lecithin in a decoction made from a mixture of cereals he regards as of importance in inducing growth.

Concerning the glucose and proteid material of a ration, L. Duclert (*Ann. École Nat. Agr. Montpellier, n. ser., 2 (1903), No. 3, pp. 212–223*).—Different amounts of glucose were fed to rabbits alone and in combination with alfalfa. The conclusion is drawn that unless the quantity eaten was excessive, glucose was thoroughly assimilated and did not exercise an effect upon the digestibility of protein.

The influence of hydroxile ions on tryptic digestion, A. Kanitz (*Ztschr. Physiol. Chem., 37 (1902), No. 1, pp. 75–80*).—Laboratory experiments are reported and discussed.

On the variations in the mineral, combined, and organized phosphorus in animal tissues, A. L. Percival (*Compt. Rend. Acad. Sci. Paris, 135 (1902), No. 22, pp. 1005–1007*).—Analyses are reported showing the relative proportions of mineral, combined, and organized phosphorus in a number of substances of animal origin. Some of the results follow:

Distribution of phosphorus in some animal products.

	Water.	Phosphorus (estimated as P_2O_5).			
		Total.	Mineral.	Combined.	Organic.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
Muscles (beef)	72.97	0.507	0.217	0.095	0.193
Heart (mutton)	77.58	1.011	.380	.305	.268
Intestine (pig)	77.58	.293	.108	.146	.038
Spleen (beef)	75.03	.570	.176	.304	.056
Liver (beef)	68.99	.561	.264	.235	.062
Pancreas (beef)	69.21	.749	.366	.369	.013
Thymus (mutton)	76.56	1.223	.454	.733	.025
Brain (mutton)	76.75	.638	.148	.370	.115
Kidney (mutton)	79.11	.458	.232	.192	.030

The analytical methods are briefly described, and the results obtained are discussed.

Phosphates in the feeding of animals, A. Gouin and P. Andouard (*Les phosphates dans l'alimentation du bétail. Nantes: C. Mellinet, 1903, pp. 37*).—The principal material containing phosphoric acid which was used in the authors' experiments with calves was powdered green bone, which was fed with a basal ration of skim milk and starch, or skim milk, oats, and coarse fodder. In some cases phosphoric acid was also tested.

Judged by these experiments a calf a month old would tolerate 6.5 gm. of powdered bone per 10 kg. body weight and digest the phosphoric acid contained quite thoroughly. The phosphoric acid was well assimilated and the amount excreted in the urine was not less than 85 per cent of the amount assimilated. The amount of nitrogen and phosphoric acid in the food and excretory products is recorded in the 2 experiments reported, each of which extended over some 6 weeks.

The authors believe that in the form of powdered bone phosphoric acid exercises a very favorable effect on the nutrition of young ruminants, increasing the amount of nitrogen retained in the tissues and at the same time increasing the chemical changes in the body which result in the formation of body heat. In connection with the work the digestibility of oats was determined.

Cassava as a feed stuff, J. C. Brunnich and W. Maxwell (*Queensland Agr. Jour., 12 (1903), No. 1, pp. 65–67*).—In connection with a study of the feeding value of cassava determinations are reported of the amount of hydrocyanic acid in young and old roots grown in Queensland. In view of the amount found the authors believe that farmers should be warned not to use cassava, in its natural state, as a human food or as a feeding stuff for animals.

Experiments on the possibility of removing the poisonous material by extractio with hot or cold water are briefly reported, which led to the following deduction "While the cassava root in its natural state contains a highly dangerous amount hydrocyanic acid, yet by treatment of the cut-up material with water, it can b rendered quite safe for food purposes. As a practical suggestion, it is advised tha the cassava roots, if used at all, should be cut up into pieces and boiled in the sam manner as potatoes are boiled for pig feed, the greatest care being taken that th water shall be completely removed, and the material further washed out with addi tional water. Concerning the actual amount of hydrocyanic acid found in cassav root by different scientists and in different countries, the indications are very stron that the controlling factors will be found to be the nature of the soil and climati conditions."

Home produce v. purchased food, J. A. VOELCKER (*Jour. Roy. Agr. Soc England, 63 (1902), pp. 330–338*).—Continuing earlier work (E. S. R., 8, p. 248) o the value of home-grown and purchased feeding stuffs, a test was made with 2 lots each containing 8 cross-bred steers. After a preliminary feeding, each lot was fed lbs. of grain per head daily in addition to 30 lbs. of roots, 4 lbs. hay, and 7.5 lbs straw chaff, the amounts being increased as the test progressed. In the case of th home-grown products the grain ration consisted of beans, oats, and wheat, 7:5:4 and in the case of purchased feeds it consisted of linseed cake, decorticated cotton seed cake, and maize meal in the same proportions. All the feeding stuffs used wer analyzed.

Four steers in each lot were fed in stalls, the others in yards, the former averagin 1,319 lbs. in weight at the beginning of the trial and the latter 1,449 lbs. The tes covered from 84 to 106 days, the different groups being sold for slaughter at differen times as they were ready. The steers fed home-grown products in stalls made a average daily gain per head of 1.5 lbs., and those fed the same products in yard 1.93 lbs. In the case of the purchased feed, the average daily gain with the steer fed in stalls was 1.98 lbs. and of those fed in yards 2.38 lbs.

Data are also reported regarding the cost of feed and live and dressed weight The author calls attention to the fact that while smaller and more costly gains were made on the home-grown products the meat produced was considered superior.

[Gains made by steers on pasturage], Supplement to Bulletin No. 73 H. W. MUMFORD (*Illinois Sta. Circ. 61, pp. 2*).—The effect of previous feeding o subsequent gains made on pasturage was studied with 2 lots, each containing 2 yearling steers used in a test previously reported (E. S. R., 14, p. 381), on the com parative merits of corn silage and shock corn. In 175 days on blue grass pasturag the steers formerly fed the silage ration made an average daily gain of 1.03 lbs. pe steer, and those formerly fed the shock corn an average gain of 1.2 lbs. Considering both of the tests the average daily gain of the silage lot was 1.249 lbs. and of the shock-corn lot 1.275 lbs.

"This does not indicate anything except that up to this time neither ration pos sessed a marked advantage for securing rapid gains on calves and yearlings up to the beginning of the finishing period. . . . The silage-fed steers have apparently large frames, and largely on this account do not appear to carry as much flesh as the shock corn-fed steers."

Feeds supplementary to corn for fattening steers, H. W. MUMFORD (*Illinois Sta. Bul. 83, pp. 541–576*).—The value of a corn ration supplemented by gluten meal and by clover hay was studied, the former feed being chosen because it is a corn product and its use is consequently of importance to corn growers, and the latter because it is believed that the possibilities of nitrogenous coarse fodders are not generally recognized.

Three lots of common to medium quality steers were selected, lot 1 being fed corn and clover hay, lot 2 corn, timothy hay, and corn stover, and lot 3 the same feeding

stuffs as lot 2 with gluten meal in addition. After a preliminary period of 3 weeks, the test proper began February 8, and covered 2 periods of 63 days each. During the first period unground corn was fed, and during the second corn-and-cob meal. At the beginning of the trial each lot contained 13 animals averaging 917 lbs. each in weight. As the trial progressed one was sold from each lot. The steers were fed in open yards, with sheds, at first coarse fodder ad libitum with 10 lbs. per head per day of grain, the amount being increased as the test progressed. At the conclusion of the trial the steers were slaughtered, the weight of the dressed carcass, organs, etc., being recorded.

The following table summarizes the results of the test as a whole:

Corn supplemented by other feeds for steers.

Feeding stuff	Nutritive ratio of the rations.	Average daily gain per steer.	Grain eaten per pound of gain.	Coarse fodder eaten per pound of gain.	Relation of live to dressed weight.
		Pounds.	*Pounds.*	*Pounds.*	*Per cent.*
Lot 1, corn and clover hay	1: 9.43	2.51	7.68	4.82	58.9
Lot 2, corn, timothy hay, and corn stover	1:13.03	1.858	9.87	5.88	57.2
Lot 3, corn, gluten meal, timothy hay, and corn stover	1: 9.42	2.268	7.44	5.14	57.7

During the first period of the test 7 pigs, averaging 130 lbs. each in weight, followed each lot of steers, the number selected being just sufficient to utilize all the undigested grain and make satisfactory gains without additional feeding. During the second period each lot was followed by 4 pigs averaging 136 lbs. in weight. The smaller number was selected because the corn-and-cob meal furnished less undigested residue than the unground grain.

Considering the test as a whole the pigs following the 3 lots gained 542, 482, and 422 lbs., respectively. Taking into account both the beef and pork produced the author calculates that the average profit per steer in the 3 lots was $13.16, $4.45, and $14.08. In his opinion the test emphasizes the importance of coarse fodder in steer feeding and indicates that clover hay may be advantageously used on account of the nitrogenous material it supplies, being especially valuable when a concentrated feed, such as gluten meal, is also used. Neither the ration of corn and nitrogenous coarse feed nor corn and nitrogenous concentrated feed was regarded as entirely satisfactory and it is believed "that some judicious combination of the two, yet to be determined, will be found more satisfactory and profitable than either.

"A ration of corn, timothy hay, and corn stover has little to recommend it for beef production. It is not favorable for the production of large, rapid, or economical gains; nor is the beef produced by the use of such a ration desirable. It requires 1.5 lbs. more grain and 0.7 lb. more roughage to produce each pound of gain where timothy hay supplemented corn than where clover hay was used.

"The corn and clover hay ration possessed the following advantages: [It is] available on Illinois farms; [it] produced large gains; considered either from the standpoint of total beef produced or the cost of such beef it was a large and economical producer; [and] the beneficial effects of the clover hay in the ration of lot 1 appeared to extend to the pigs, as not only were greater gains in live weight of pigs made in lot 1 than in the other lots, but also more economical gains."

In the author's opinion the slaughter test showed that a ration of corn and timothy had a tendency to produce a high percentage of internal fat without a relatively high percentage of dressed beef, thickness of flesh, or layer of surface fat, which are important items from a market standpoint.

"It is impossible to determine whether the corn and clover hay ration or the corn,

gluten meal, timothy hay, and corn stover ration had the greater tendency to produce lean beef, or flesh as greater gain of the steers fed corn and clover hay would naturally be followed by thicker flesh provided their lean beef making tendencies were the same. It is evident, however, that both the corn and clover hay rations and the corn, gluten meal, timothy hay, and corn stover ration had an advantage over the corn, timothy hay, and corn stover ration in this respect.

"It appears that the ration, where gluten meal is the conspicuous nitrogenous factor, has the ability to produce the finish demanded by the market with the least expenditure of both quantity and cost of food stuffs of any ration used in this experiment. The fact that there was more profit to the producer in the use of the ration containing gluten meal, notwithstanding the somewhat expensive nitrogenous concentrate used, is due to the combined facts of its being an equally effective ration as corn and clover hay to the securing of better finish without the necessity of putting on the maximum amount of unprofitable gains in live weight, and to the current prices of corn, gluten meal, and clover hay.

"The value of the manure made by the steers in lot 1 would be much more valuable per ton than that made by either of the other lots."

The author also calls attention to the fact that the condition of the feed lots is an important factor both as regards the extent and economy of the gains made. Thus, when the feed lots were dry and there was little variation in the weather gains were much more satisfactory than when the lots were muddy and the variations in temperature and humidity were great and sudden.

Live stock investigations, H. W. Mumford (*Illinois Sta. Circ. 65, pp. 29, figs. 2*).—The live stock investigations at the station are discussed and experiments previously noted (E. S. R., 14, pp. 381) and those reported above are summarized.

"Cremaval" as a supplement to skim milk in feeding calves, C. Moser and J. Käppeli (*Ann. Agr. Suisse, 3 (1902), No. 8, pp. 315–326, figs 2*).—As was the case with earlier tests[a] Cremaval, a commercial substitute for natural milk fat, did not give favorable results with calves. In the investigation now reported whole milk had a feeding value of 2.91 cts. per liter, and the Cremaval ration 3.55 cts.

Sheep breeding, R. Doyle (*Transvaal Agr. Jour., 1 (1902), No. 1, pp. 42, 43*).—The subject is discussed with special reference to local conditions.

Economy of roots in sheep feeding, J. A. Voelcker (*Jour. Roy. Agr. Soc. England, 63 (1902), pp. 338–346*).—Using 4 lots of 10 sheep each, the value of roots was studied. Lot 1 was given a full ration of roots and lot 2 a limited ration of roots, with linseed cake and clover hay in both cases. Lot 3 was also given a limited supply of roots and was fed linseed cake and chopped gorse in addition. Lot 4 received no roots, but was fed linseed cake and hay moistened with cane-sugar molasses mixed with water. The roots used were Swedish turnips and later kohl-rabi. The test covered from 87 to 108 days, the different lots being sold as soon as they seemed ready for market. At the beginning of the trial the average weight of the sheep was practically 117 lbs. per head. The gain ranged from 26.5 lbs. with lot 4, receiving no roots, to 43.2 lbs. with lot 1, fed a full supply of roots. The feeding period was the longest with the former lot and shortest with the latter.

According to the author, "feeding sheep on a limited supply of roots will not fatten them as well or as quickly as giving them a more liberal supply of roots. Feeding sheep on the land without any roots, and making up for the deficiency by giving extra hay, with treacle and water, will result in considerable financial loss, and feeding with gorse in partial replacement of hay will give good mutton, but no economical advantage over hay."

Sugar beet as food for sheep (*Jour. Bd. Agr. [London], 9 (1902), No. 3, pp. 225, 226*).—A test carried on at the Southeastern Agricultural College at Wye in 1900, with 2 lots of 12 sheep each and covering 12 weeks, showed that when they were

[a] Ann. Agr. Suisse, 3 (1902), No. 3, pp. 59–70.

fed mangels in addition to a grain ration (corn, oats, and linseed cake) there was an average daily gain of 40.5 lbs. per sheep as compared with 33 lbs. when sugar beets were fed with the same grain ration. The sugar beets eaten were grown on 0.909 acre and the mangel-wurzels on an acre. The cost of growing the latter was less than the former.

The test was repeated in 1901 with 2 lots of 16 sheep each, fed respectively mangel-wurzels and sugar beets in addition to 1 lb. per head per day of oats, maize, and linseed cake. In the 8 weeks of the test the sheep fed mangel-wurzels made an average gain of 30 lbs. each, and those fed sugar beets of 22 lbs. "Moreover, the sheep which had received mangolds handled better, and their wool looked brighter than in the case of those receiving sugar beet. These results were, therefore, even more unfavorable to sugar beet than those obtained in the trials of the preceding year."

Angora goats in Australia (*Queensland Agr. Jour., 12 (1903), No. 2, pp. 113–116, pl. 1*).—The possibilities of Angora goat raising under local conditions are discussed, as well as the importation of goats and goat management.

On the growth of suckling pigs fed on a diet of skimmed cow's milk, Margaret B. Wilson (*Amer. Jour. Physiol., 8 (1902), No. 3, pp. 197–212*).—In continuation of previous work by L. C. Sanford and G. Lusk, which is noted in detail, the author tested the comparative feeding value of skim milk with and without the addition of dextrose and lactose. Six new-born pigs of the same litter were obtained. Three were slaughtered and analyzed, and each of the rations tested was fed to one of the 3 remaining pigs. In the 16 days of the test the pig fed skim milk made a total gain of 883 gm.; that fed skim milk with 30 gm. of lactose hydrate per liter gained 1,140 gm., and the pig fed skim milk with the same amount of dextrose gained 986 gm. At the close of the test the pigs were slaughtered and analyzed. Below is the author's summary of this test and the earlier one referred to above:

"Skimmed cow's milk, with or without 2 to 3 per cent of added lactose or dextrose, is normally absorbed by suckling pigs. Two pigs fed on skim milk from 14 to 16 days gained 26.4 and 66.8 per cent in weight. Two pigs fed on the same skim milk, with 2 and 3 per cent of lactose added, gained 79.7 and 88 per cent in weight. Two pigs fed on the same skim milk, with 2 and 3 per cent dextrose added, gained 73.6 and 64.4 per cent in weight.

"Those fed with plain skim milk gained 114 and 218 gm. in weight for every 1,000 physiologically available calories in the food. The lactose pigs gained 222 and 215 gm. per 1,000 calories in the food. The dextrose pigs both gained 213 gm. per 1,000 calories in the food. Except in the case of one ill-nourished skim-milk pig, the growths of the sucklings stand in a constant ratio to the calories in the food.

"The pigs fed on plain skim milk used 23 and 35 per cent of the proteid in the food for tissue growth, the lactose pigs used 38 and 44 per cent, and the dextrose pigs 48 and 42 per cent. All the pigs of the second litter gained in fat when fed on plain skim milk or on skim milk with sugars.

"The percentage of calcium in the bodies of the pigs diminished with their growth. There was considerable and normal deposition of calcium in the pig, and this was proportional not to the calcium in the food, but to the growth of the animal. Not only is the growth in grams of the pigs proportional to the calories in the food, but the number of calories retained in the tissue substance during growth is proportional to the calories in the food. Eighteen to 19 per cent of the calories in the food were found stored in the tissue growth of the pigs fed on the 3 varieties of skimmed milk.

"There seems to be striking evidence that the suckling pig reared on skimmed cow's milk conforms to the same laws of nutrition as the breast-fed infant."

Measures for increasing pig raising, O. Knispel (*Arb. Deut. Landw. Gesell., 1903, No. 77, pp. 135*).—The author describes the methods followed in different German States to encourage pig raising. He mentions the work undertaken by breeding societies, offering of prizes, vaccination of pigs, and related topics.

The management of swine, L. PRICE (*Queensland Agr. Jour., 12 (1903), No. 1, pp. 34–36*).—On the basis of his own experience the author discusses the subject with reference to local conditions.

Molasses as a food for horses, G. H. BERNS (*Amer. Vet. Rev., 26 (1902), No. 7, pp. 615–623*).—In addition to discussing some of the recent experiments on the value of molasses as a food for horses, the author reports several tests with a ration containing this material. Two horses weighing respectively 900 and 940 lbs. gained, in 6 weeks, 175 and 146 lbs., respectively, when fed 3 times a day 1 qt. of molasses (diluted with 3 qts. of water) mixed with 5 lbs. of cut hay. No long hay was fed in addition. They were given all the water they desired, but had no exercise. At the close of the test it is stated the animals were markedly improved in condition and "did their work well, in spite of the fact that they had not been exercised in 6 weeks."

A molasses ration was then fed for 14 months to 100 heavy truck horses, averaging 1,700 lbs. in weight, working 10 hours a day drawing very heavy loads, usually at a walk. They were fed per head morning and night 1 qt. of molasses diluted with 3 qts. of water, and thoroughly mixed with 6 lbs. of cut hay of good quality, 1.5 qts. corn meal, and 2.5 qts. of coarse bran, and in addition 5 qts. of dry oats in the middle of the day and 11 lbs. of long hay at night. It is stated that the animals gradually improved in condition and gained in weight, their coats becoming slick and glossy, while at the same time as much work was performed as before the test began. The general health of the horses was said to be excellent, cases of acute indigestion or spasmodic colic being rare, although formerly such attacks were of frequent occurrence.

Brief notes are also given regarding the successful feeding of a similar molasses ration to a number of other horses, of which 5 were driving horses. The author's summary follows:

"Molasses of a good quality is a most nutritious food for horses, easily digested and assimilated, and will in many cases correct faulty digestive processes. One quart of molasses at a cost of 3 cts. will take the place of from 3 to 4 qts. of good quality oats at a cost of from 4.5 to 6 cts.

"A sudden change from dry oats to molasses mixed with other food stuffs is perfectly safe and causes no disturbances of the digestive organs. Molasses-fed horses will do fully as much work and at the same time remain as a rule in much better general condition than animals fed on dry food, while the cost of feeding is reduced from 25 to 33 per cent."

Feeding experiments with horses: "Pail-mel" and maize, L. GRANDEAU (*Jour. Agr. Prat., n. ser., 5 (1903), No. 7, pp. 208–210*).—A test with 3 horses is reported in which a molasses feed called "Pail-mel," which is a mixture of straw and molasses, was used. The amount of work done was measured by a dynamometer.

Nutritive value of "Pail-mel," a molasses feed, L. GRANDEAU (*Jour. Agr. Prat., n. ser., 5 (1903), No. 6, pp. 177–179*).—The author reports the coefficients of digestibility of the rations fed when the horses were at rest, walking, and working. Data are also recorded regarding the amount of water consumed. The amount of molasses eaten varied from about 2.5 to 3.5 kg. per day. The animals all gained in weight, and the results as a whole are regarded as favorable to molasses feeding.

Handbook of horse raising, L. BORN and H. MÖLLER (*Handbuch der Pferdekunde. Berlin: Paul Parey, 1902, pp. VIII + 468, figs. 211*).—This is the fifth revised edition of this volume, which is designed as a handbook for army officers and agriculturists. It treats especially of the anatomy and physiology of the horse, points, diseases, training, shoeing, and feeding.

Horse raising in the Rhine countries in the light of statistics, OLDENBURG (*Landw. Jahrb., 31 (1902), No. 5–6, pp. 791–821, maps 3*).—Horse raising in relation to agriculture is discussed on the basis of statistical data.

Poultry division report, D. D. Hyde (*New Zealand Dept. Agr. Rpt. 1902, pp. 127–134, pls. 4, figs. 2*).—Brief statements are made regarding the poultry at the different New Zealand experiment stations. The export trade in poultry and eggs, especially with England and South Africa, is discussed at some length.

Profitable poultry farming, F. C. Hare (*Canada Dept. Agr. Comr's Branch, Poultry Division Bul. 6, n. ser., 1902, pp. 47, figs. 37*).—Poultry raising, dressing, marketing, poultry diseases, and other subjects relating to the poultry and egg trade are discussed.

Experiments in artificial incubation (*Queensland Agr. Jour., 12 (1903) No. 2, pp. 117, 118*).—The tests reported show the need of moisture in the air of incubators and the desirability of adding it if removed too rapidly.

"The fatal effect of a rapid evaporation is to be found in the drying of the inclosing membrane of the eggs, or, in other words, the membrane covering the ovum becomes too dry to take up enough oxygen to suffice for the development and vital activity of the embryo, for while most animal membranes allow the exchange of carbon dioxid and oxygen to be effected with perfect ease, offering no serious impediment to the passage of either gas, dry membranes are impermeable to gases. Although the drying of the covering membranes often cuts short the development of the embryo, and the germs die at different stages of incubation, this most frequently takes place from the above cause from the seventeenth day to the end of the term, the greatest number dying about the eighteenth or nineteenth day."

The spoiling of hens' eggs preserved in wood ashes, H. Svoboda (*Oesterr. Chem. Ztg., 5 (1902), No. 21, pp. 483, 484*).—From experimental data the conclusion is drawn that wood ashes are not satisfactory for preserving eggs. It was found that when eggs were thus preserved the ash content was increased. An analysis of the ash of such eggs is reported.

The history of geese, J. J. McCue (*Queensland Agr. Jour., 12 (1903), No. 1, pp. 40–43*).—In this article, which is quoted from *Station, Farm, and Dairy*, the author describes the principal breeds of geese, including the black and white goose and the cereopsis goose, which are Australian varieties.

Ducks, G. Rogeron (*Les canards. Paris: J. B. Baillière & Son, 1903, pp. VIII +, 435, pl. 1*).—Different sorts of wild and domestic ducks are treated of, as well as the general subject of duck raising.

DAIRY FARMING—DAIRYING.

Feeding trials with cows, J. L. Hills (*Vermont Sta. Rpt. 1902, pp. 273–318+ XXXVIII*).—This is the fifth year in which feeding experiments have been conducted along the same general line. Tests to compare low, medium, and heavy grain rations, to determine the feeding value of apple-pomace silage, and to ascertain the extent of experimental error in feeding trials made in previous years were repeated, and new trials were conducted to study the feeding value of malt sprouts, dried brewers' grains, and gluten meals of high and low protein content. The work is reported in detail and summarized, and an appendix contains the tabulated data. The trials covered a period of 24 weeks and included 50 cows. Each trial lasted 28 days, the conclusions in every case being based upon the results obtained during the last 18 days.

A comparison of 4, 8, and 12 lbs. of grain was made with 26 cows, with results essentially the same as previously obtained (E. S. R., 14, p. 78). An increase in the grain ration increased the yield of milk and butter, but not in proportion to the amount of grain fed. Changing from a low to a medium grain ration increased the yield of milk 9 to 13 per cent, and changing from a medium to a high grain ration did not increase the yield over 3 per cent. The quality of the milk was not materially affected. The dry matter in the low grain ration made proportionately more milk and butter than the dry matter in the medium ration, and the same was true when

the medium ration was compared with the heavy ration. The weights of about two-thirds of the cows increased or decreased as the amount of grain fed was increased or decreased. From a financial standpoint the results for 3 years were unfavorable to the high grain ration. For continuous dairy feeding the author favors a medium grain ration, 4 lbs. being considered lower than is advisable with cows of the better class.

Four cows were used in comparative tests of malt sprouts with (1) cotton-seed meal, linseed meal, and bran, and (2) oats and bran. As compared with mixture No. 1, malt sprouts decreased the yield of milk 10 per cent, but did not affect the quality of the milk nor the yield in relation to the amount of dry matter consumed. The use of malt sprouts was less economical. As compared with mixture No. 2, malt sprouts decreased the yield of milk 4 per cent, the quality remaining unchanged. The dry matter consumed was 9 per cent less, making the yield in proportion to the dry matter 5 per cent greater than when oats were fed. The malt sprouts were not readily eaten by the cows in either experiment.

The relative feeding value of dried brewers' grains and a mixture of cotton-seed meal and linseed meal was tested with 1 cow. There was no marked difference in the yield and quality of milk. The use of brewers' grains was the more economical.

Gluten meals containing, respectively, 29.2 and 36.7 per cent of protein were compared with 4 cows, the results showing practically no difference as regards the yield and quality of milk and the amount of dry matter consumed.

A third trial of apple pomace was made with 12 cows. As much milk and 3 per cent more butter was produced on apple pomace as on corn silage. The yield per unit of dry matter was 7 per cent greater in the case of the pomace ration. No unfavorable effects were observed. A ton of apple pomace is considered as having practically the same feeding value as a ton of silage.

Additional data concerning the experimental error involved in feeding trials served to confirm the view already advanced that if 2 or 3 animals are used the experimental error inherent in the alternation method may be quite disregarded.

A comparison of feeding trial methods, J. L. Hills (*Vermont Sta. Rpt. 1902, pp. 318–327*).—In earlier experiments (E. S. R., 14, p. 79) two methods of feeding were compared, one in which different rations were fed to the same group of animals during alternate periods, and one in which the animals were divided into 2 groups, one group being fed continously on one ration and the other group alternately on different rations. While the results of the previous work seemed to show but little difference in the two methods, the present trials, made on a more extensive scale, favor the plain alternation system. The work is to be continued in the hope of arriving at more definite and satisfactory results.

Records of the station herd for 1900–1 and for 1901–2, J. L. Hills (*Vermont Sta. Rpt. 1902, pp. 327–342*).—These records are similar in character to those previously reported (E. S. R., 13, p. 586). The average results for the 2 years are respectively as follows: Number of cows 47 and 49, yield of milk 5,814 and 5,166 lbs., fat content of milk 5.07 and 5.03 per cent, yield of butter 344 and 308 lbs., cost of food $49.97 and $49.13, and proceeds from sales of butter $94.56 and $85.33.

A comparison of score card judgments and of milk and butter records, J. L. Hills (*Vermont Sta. Rpt. 1902, pp. 342–344*).—The station herd and 2 private herds were scored, the results being compared afterwards with the milk and butter records of the cows. The work was done by R. R. Strait, under the author's directions. In all 62 records were used in the comparison. The results seem to show that in the long run cows scoring high were but little if any superior as milk and butter producers. On the other hand, a relationship between lack of conformation to dairy types and lessened production was considered as plainly established.

The effect of feed on the quality of butter, J. L. Hills (*Vermont Sta. Rpt. 1902, pp. 345, 346*).—In connection with the feeding experiments noted above and in con-

tinuation of previous work (E. S. R., 14, p. 79), 43 samples of butter, representing 191 churnings, were analyzed to determine the effect of different feeding stuffs upon the quality of the butter. As shown by analysis, apple pomace, corn silage, and dried brewers' grains had no effect upon the quality of the butter. Malt sprouts and ground oats, especially the latter, decreased the iodin number. Germ oil meal increased the iodin number. The gluten meals tended to produce soft butter. The content of volatile fatty acids was increased and the melting point and iodin numbers were reduced. As measured by inspection, the only bad effects on the quality of the butters were observed for a short period when malt sprouts were fed.

The change from barn to pasture, J. L. Hills (*Vermont Sta. Rpt. 1902, pp. 346–350*).—Records of the station herd for 8 years as regards the yield and quality of milk for the 2 weeks preceding and the 6 weeks following a change from barn to pasture are discussed. During 4 years a majority of the cows showed a tendency toward immediate and decided improvement, followed by a return to the original quality. There was one year in the majority of cases a slow tendency toward improvement. During 3 years the quality of the milk of the majority of the cows remained practically unchanged. Reasons for the facts observed are not advanced. It is considered clearly established that no poorer milk results from pasture feeding even when the flow is considerably increased.

Dairy conditions and suggestions for their improvement, W. J. Fraser (*Illinois Sta. Bul. 84, pp. 577–631, figs. 46*).—The dairy conditions in the State have been under investigation by the station during the past 6 years. In some particulars the conditions are considered ideal, while in others they are far below the proper standard. This bulletin aims to suggest remedies for the faults most commonly found in actual practice. Some of the subjects discussed are the location and construction of barns and stables, care of yards, cleanliness in milking, care of milk and dairy utensils, feeding cows, construction and management of creameries, and markets for dairy products, numerous practical suggestions being made in each case.

Experiments to compare the amount of dirt falling from washed and unwashed udders during the process of milking are reported as follows: "It was determined after several trials with 3 different milkers on 30 cows that it requires an average of 4½ minutes to milk a cow. A glazed dish 11 in. in diameter, the size of an ordinary milk pail, was placed in the top of a pail and held under a cow's udder in the same position as when milking. For 4½ minutes the milker then went through motions similar to those made in milking, but without drawing any milk. The amount of dirt which fell into the dish during the operation was, of course, approximately the same as would have gone into the milk during the milking process. The dirt caught in the dish was then brushed into a small glass weighing tube, the udder washed, and the process repeated. The dirt which fell from the washed udder was also carefully brushed into a weighing tube. Both tubes were then placed in a desiccator, and after drying 24 hours were accurately weighed on a chemical balance. Sixty trials were made at different seasons of the year. With udders that were apparently clean it was found that an average of 3½ times as much dirt fell from the unwashed udders as from the same udders after they were washed. With soiled udders the average was 22 and with muddy udders the average was 94 times as much dirt from the unwashed udders as from the same udders after washing."

Dairy investigations, W. J. Fraser (*Illinois Sta. Circ. 63, pp. 7*).—This is a report of progress on the dairy work which has been carried on by the station for nearly 2 years under State appropriations.

Variations in the composition of cows' milk, H. Ingle (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 135–182, figs. 12*).—The author summarizes the results of his earlier investigations relating to the composition of milk (E. S. R., 14, p. 80) and reports further work, the main objects of which were to ascertain the effect of unequal intervals between milkings upon the composition of the milk, and

to discover a means of diminishing the difference in fat content between morning and evening milk when the intervals are unequal. Incidentally separate analyses were made of the milk yielded by each quarter of the cow's udder.

Five cows were milked at 6 a. m. and 3 p. m. during a period of 2 weeks. The average fat content of the morning milk was 2.87 per cent, and of the evening milk 4.26 per cent, the ratio between the two being 1:1.484. During the 4 weeks following the same cows were milked at 5.30 a. m. and 5 p. m. The fat content of the morning and evening milk was, respectively, 3.18 and 3.80 per cent, the ratio being 1:1.195. During a third period of 3 weeks with the hours of milking the same as in the first period the percentages of fat in the morning and evening milk were, respectively, 2.94 and 4.40, the ratio being 1:1.497. The results confirm the generally accepted conclusion that the low fat content of morning milk as compared with evening milk is due to unequal intervals between milkings. Following a change from unequal to approximately equal intervals the difference in percentages of fat gradually lessened.

The attempt was made to improve the quality of the morning milk by methods of feeding, the intervals between milkings remaining unequal. Cows on pasture were fed a grain mixture consisting of equal parts of cotton-seed meal and corn meal, one group receiving 3 lbs. morning and evening, one group 6 lbs. in the morning only, and one group 6 lbs. in the evening only. The different methods of feeding did not alter very much the relative yield of milk morning and evening. When the grain was fed only in the morning the fat content of the morning milk was increased, from which it would seem that where circumstances necessitate unequal intervals this plan of feeding would lessen the danger of the morning milk being below the standard.

The milk from each quarter of the udders of 2 cows was collected separately for 6 days and analyzed. The fat content showed no constant variations. In both cases, however, the milk from the left fore quarter was much smaller in quantity and lower in solids-not-fat than that from the other quarters. These results led to tests of the herd of 19 cows, the average results of which are given in the following table:

Yield and quality of milk from different quarters of the udder.

	Yield of milk.	Fat content.	Solids-not-fat.
	Pounds.	*Per cent.*	*Per cent.*
Right fore quarter	2.42	3.86	8.78
Right hind quarter	2.47	3.96	8.63
Left fore quarter	1.85	3.84	8.45
Left hind quarter	2.50	3.85	8.71

"The variation in fat in milk from different quarters of the udder is perhaps not surprising when we remember that the fat is apparently produced by the breaking down of fat cells in the gland itself; but that different glands, or different parts of the same gland, should be able to elaborate, from the same blood supply, products of different concentration in dissolved matter, appears to the writer to be very remarkable. The results should certainly prove of interest to the physiologist, though they perhaps have little practical importance from a dairy point of view."

Ayrshire herd tests, F. W. Morse (*New Hampshire Sta. Bul. 96, pp. 113–124*).—Tests of Ayrshire cows have been conducted by the station since 1894, some of the data being given in tabular form. The tests made during 1901 and 1902 show a range in the percentages of fat from 3.48 to 4.40, with an average of 3.88 per cent, and a range in the total solids from 11.71 to 13.27, with an average of 12.55 per cent. The author concludes that some of the herds are developing the quantity of milk at the expense of quality. Of 21 cows tested during the year, 15 gave the maximum fat test in the first month, and 13 the maximum yield of milk in the second month.

The milk supply of London, M. Beau (*Jour. Agr. Prat., n. ser., 5 (1903), No. 17, pp. 535–537*).—A brief general description of the milk supply of London.

Diminution of the content of lecithin in heated milk, Bordas and Raczkowski (*Compt. Rend. Acad. Sci. Paris, 136 (1903), No. 1, pp. 56, 57*).—As compared with the quantity in raw milk, the percentage of lecithin was reduced 14 per cent by heating for 30 minutes at 60° C., 28 per cent by heating over a flame for 30 minutes at 95°, 12 per cent by heating over a water bath for 30 minutes at 95°, and 30 per cent by heating in an autoclave for 30 minutes at 105 to 110°.

The water content of creamery butter, H. E. Alvord (*U. S. Dept. Agr., Bureau of Animal Industry Circ. 39, pp. 4*).—Previously noted from another source (E. S. R., 14, p. 523).

The relation of carbon dioxid to proteolysis in the ripening of Cheddar cheese, L. L. Van Slyke and E. B. Hart (*New York State Sta. Bul. 231, pp. 21–41*).—The investigations reported in this bulletin are summarized by the authors as follows:

"(1) The object of the work described in this bulletin was to ascertain the extent to which carbon dioxid is formed in American Cheddar cheese during long periods of time in the process of ripening, and also to learn the nature of the chemical changes that give rise to the production of this gas.

"(2) Two cheeses were used for this study. One was entirely normal; the other was made from milk containing chloroform and kept under antiseptic conditions. The investigation was continued 32 weeks, when a chemical study was made of the proteolytic end-products.

"(3) In the normal cheese, carbon dioxid was given off continuously, though in decreasing quantities after about 20 weeks, and had not ceased at the end of 32 weeks. The total amount thus produced was 15.099 gm., equal to 0.5 per cent of the fresh cheese. In the chloroformed cheese, the total amount of carbon dioxid produced was 0.205 gm., practically none being found after 3 weeks.

"(4) In the normal cheese, the following end-products of proteolysis were found: Tyrosin, oxyphenylethylamin, arginin in traces, histidin, lysin, guanidin, putrescin in traces, and ammonia. In the chloroformed cheese were found the same compounds, except oxyphenylethylamin, guanidin, putrescin, and ammonia; but arginin was found in marked quantities for the first time in cheese.

"(5) A consideration of the possible sources of carbon dioxid in the 2 cheeses indicates that in the case of the chloroformed cheese the carbon dioxid came from that present originally in the milk and that formed in the milk from the decomposition of milk-sugar before treatment with chloroform. In the case of the normal cheese, the carbon dioxid given off in its early age came largely from the decomposition of milk-sugar by lactic-acid organisms, while a small amount was probably due to the carbon dioxid present in the milk and to the respiration of living organisms present in the cheese. The carbon dioxid produced after the first few weeks came apparently from reactions taking place in some of the amido compounds, among which we were able to identify the change of tyrosin and arginin into derived products with simultaneous formation of carbon dioxid.

"(6) In the chloroformed cheese, the only active proteolytic agents were lactic acid, galactase, and rennet-pepsin. Under the conditions of our experiment, these agents were able to form neither ammonia nor secondary amido compounds with production of carbon dioxid. The presence of chloroform could not account for this lack of action. These results suggest that in the normal cheese there must have been some agent at work not present in the chloroformed cheese and that this extra factor was of a biological character."

Rusty spot and a remedy, F. H. Hall, H. A. Harding, and G. A. Smith (*New York State Sta. Bul. 225, popular ed., pp. 7*).—A popular summary of Bulletin 225 of the station (E. S. R., 14, p. 908).

Report of the seventeenth annual meeting of the Granite State Dairymen's Association, 1901 (*Granite State Dairymen's Assoc. Rpt., 17 (1901), pp.*

77).—This report includes the following addresses: Dairying in France, by H. E. Alvord; Creamery and Dairy Practice, by G. A. Smith; Some Points of the Dairy and its Adjuncts, by F. L. Davis; and New Hampshire Dairy Products at the Pan-American Exposition, by W. D. Baker.

Officials, associations, and educational institutions connected with the dairy interests of the United States for the year 1903 (*U. S. Dept. Agr., Bureau of Animal Industry Circ. 40, pp. 11*).

VETERINARY SCIENCE AND PRACTICE.

The first Norwegian veterinary meeting (*Maanedsskr. Dyrlæger, 14 (1902), Nos. 6, pp. 253–303; 7, pp. 313–394; 8, pp. 403–469; 9, pp. 481–520*).—Among the large number of papers read at this meeting brief notes may be given on the following:

Combating bovine tuberculosis, J. Fibiger (pp. 253–255).—The author's experiments indicate that tubercle bacilli obtained from a young child were highly virulent for calves, and that therefore the disease as observed in man and animals can not be considered essentially different.

The work of combating bovine tuberculosis in Norway, Malm (pp. 259–274).—This work is said to have begun in 1891 and has since been prosecuted actively, with the aid of government appropriation. Tables are presented showing the number of localities in which infected herds are found, the breed of animals affected, and the percentages of tuberculous cattle as shown by tuberculin tests.

Combating tuberculosis in Sweden, G. Regnér (pp. 274–286).—Detailed notes are given on the temperature reactions in 250,321 cattle tested with tuberculin during the years 1897–1901, and other tables are given showing the percentages of infected animals in different herds.

The control of food materials with special regard to preservatives for meat, A. Jacobsen (pp. 313–346).—Notes are given on the etiology of cases of meat poisoning which have been found to be due largely to the presence in meat of *Bacillus coli communis, B. enteritidis, B. morbificans bovis,* and *B. proteus vulgaris.* Special attention is given to the effect of various preservatives upon these bacteria and upon the keeping quality of meat, as well as upon the health of human beings.

Castration of Cryptorchids, F. Winter (pp. 358–388).—The literature of this subject is briefly reviewed and detailed descriptive notes are given on the various methods which have been devised and successfully used by various veterinary surgeons in performing this operation.

Results obtained by neurectomy, especially in cases of spavin, L. Morkeberg (pp. 403–433).—Detailed descriptions are given of a large number of cases in which neurectomy was performed for the cure or relief of spavin. In many cases double neurectomy is required, but according to the author's experience this method may be depended upon to bring about the desired results in about 70 per cent of cases.

Artificial insemination in mares, Sand (pp. 481–489).—The author believes that this operation may be resorted to with good results and may prove an important economic device under certain circumstances connected with the breeding of horses.

Aspergillosis in animals artificially fed upon milk, von Hellens (pp. 512–520).—A number of cases of this disease were observed by the author, especially in colts. The pathological anatomy of the disease sometimes gives rise to confusion with tuberculosis, and notes are given on the means of making a reliable differential diagnosis.

Report of chief veterinary inspector, J. G. Rutherford (*Rpt. Min. Agr. Ontario, 1902, pp. 71–152*).—This report includes, besides a general account of the health of animals by the chief inspector, a large number of reports of veterinary inspectors in

various parts of the Dominion of Canada. The majority of outbreaks of hog cholera reported were apparently due to the importation of hogs from infected parts of Ontario or from the United States. During the year 1,277 cattle were tested with tuberculin for export into the United States. Of this number 72 reacted. Very little testing of dairy cattle was done during the season. Experiments to determine the period which elapses between actual infection and the time when tuberculin produces a reaction indicate that this period varies from 8 to 50 days. It is recommended that so long as an animal does not show pronounced signs of generalized tuberculosis its progeny should be reared. A number of cases of glanders are reported. The author believes that a large percentage of glanderous horses ultimately recover without treatment. It is also suggested that horses which cease to react to mallein are no longer infectious.

Further studies were made on the Pictou cattle disease. This is a cirrhosis of the liver. Nothing definite has been learned regarding its cause. A report by W. H. Pethick contains a description of the conditions which actually prevail in the region where this disease is observed. It is stated that cattle raisers usually consider this disease as due to feeding upon ragwort (*Senecio jacobæus*). Actinomycosis is said not to be so frequent as in former years. A few cases of anthrax were observed, but the infected area was closely quarantined and the ground subsequently burned over twice. Blackleg prevailed to considerable extent in the Northwest Territories and Manitoba. Verminous broncho-pneumonia appears to be on the increase among hogs in Ontario, especially where these animals are kept under unfavorable hygienic conditions. Brief notes are given on mange in cattle and horses, and on sheep scab.

Swamp fever in horses has prevailed in Red River Valley for a number of years, with very fatal results. This disease was investigated by the author and also by F. Torrance. The symptoms and the course and lesions of the disease are described in detail. It was shown that the disease is not surra. An organism was isolated which occurs more frequently than any other in cases of swamp fever, but inoculation experiments have thus far failed to demonstrate definitely its causal connection with the disease. A number of experiments were made on guinea pigs by C. H. Higgins to determine whether electric currents of high frequency exert any curative influence in cases of tuberculosis. The guinea pigs were inoculated with material obtained from a tuberculous steer. The treatment consisted in exposing the animals for 10 minutes daily to the effects of electric currents. After a few days' treatment the exposure was increased to 20 minutes per day. Detailed notes are given on the progress and duration of the disease in different animals. It was found as a result of these experiments that electric currents of high frequency exert a beneficial influence in assisting animals to overcome the action of tubercle bacillus. The average life of treated animals was 42.4 days, while that of untreated animals was 28.5.

Report of the city veterinarian, W. W. Richards (*War Dept., Bureau of Insular Affairs, Philippine Com. Rpt. 1902, pt. 1, pp. 380–383*).—The author presents brief statistical notes on the numbers of domestic animals shipped into the Philippines from different countries. A brief discussion is also given on the diseases which have been observed among animals. The bladder worm was found quite extensively in hogs slaughtered at the public abattoir in Manila. Among 1,500 horses inspected 40 were found affected with glanders and all were killed. The public abattoir in Manila is under the supervision of a native inspector and from the notes kept concerning the numbers and conditions of animals slaughtered at this abattoir brief statistics are presented giving the number of condemned animals and causes of condemnation.

Work of the biological laboratory, D. C. Worcester (*War Dept., Bureau of Insular Affairs, Philippine Com. Rpt. 1902, pt. 1, pp. 293, 294*).—Brief notes on the work of this laboratory, which has been occupied largely in the preparation of sera for the detection and treatment of Asiatic cholera, surra, glanders, hog cholera, etc.

A large number of examinations were made of pathological tissue sent in from various localities. Considerable work has been done in the preparation of cultures of locust fungus to be distributed throughout the different provinces.

Bacterial diseases of animals, E. THIERRY (*Jour. Agr. Prat., n. ser., 5 (1903), No. 3, pp. 77–79*).—Brief notes are given on the etiology of different classes of infectious diseases of animals.

Microbes and diseases of farm stock, J. DUNSTAN (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 1–32, pls. 8*).—The objects of this article are to describe the essential features of bacteriology as applied to diseases, to draw attention to some of the most prevalent diseases of farm animals, and to indicate methods for dealing with them. Notes are presented on the biology of pathogenic microorganisms, and on immunity, disinfection, anthrax, tuberculosis, glanders, blackleg, hog cholera, tetanus, pneumonia, strangles, contagious mammitis, contagious abortion, white scours, arthritis, actinomycosis, rabies, septicemia, ringworm, etc.

The nursing of veterinary patients, H. A. WOODRUFF (*Agr. Student's Gaz., n. ser., 11 (1902), No. 2, pp. 43–48*).—Attention is called to the necessity of exercising special care in feeding and watering diseased animals in order to secure the best results from medicinal treatment.

Theories of immunity and their clinical application, A. S. GRUNBAUM (*British Med. Jour., 1903, Nos. 2203, pp. 653–655, fig. 1; 2204, pp. 715–720; 2205, pp. 783–786*).—These were the 3 Goulstonian lectures delivered by the author at the Royal College of Physicians, London. The author discusses the theories of Metchnikoff and Ehrlich and shows that while they are apparently antagonistic, they are founded upon essentially the same phenomena and are different interpretations of the same functions. The following matters belonging to the general subject of immunity are discussed: Antitoxins, hemolysins, cytotoxins, incubation of diseases, effects of protective inoculation and infection on immunity, relapses and reinfections, predisposition, susceptibility, serum diagnosis, and partial agglutinins.

The antitoxic power of the organism and tissues toward certain poisons, G. ANGELICI (*Gior. R. Soc. Accad. Vet. Ital., 51 (1902), Nos. 46, pp. 1145–1151; 47, pp. 1169–1171; 48, pp. 1202–1205; 50, pp. 1271–1277; 51, pp. 1295–1299; 52, pp. 1314–1317; 52 (1903), No. 1, pp. 12, 13*).—In the long series of experiments reported in this article the author tested the effect of certain poisonous substances, especially strychnin, upon the organism as a whole and upon the various tissues. Particular attention was given to the resisting power of the organism to poisons and to an investigation of the cause of this resistance. The experimental animals used by the author were chiefly guinea pigs and frogs, and the alkaloids with which most experiments were made were strychnin and nicotin. The alkaloids were injected hypodermically and intravenously. It was found that normal tissues may become somewhat edematous under the influence of strychnin when this is injected repeatedly. This alkaloid, however, spreads from the point of injection for considerable distances without undergoing any alteration. When fatal doses of strychnin are given in connection with olive oil in the form of an emulsion the poisonous effect of the strychnin is not produced. The same results were obtained from the use of phenol in frogs. The poisonous properties of calomel were similarly attenuated by mixing with olive oil. The author believes that the liver has the power of retaining and greatly altering alkaloids, especially strychnin, and this organ may be therefore considered as an important means of protecting the organism against the poisonous effects of strychnin. A brief bibliography of the subject is appended to the article.

Experimental study of inflammatory neomorphs in connective tissue, A. MAXIMOW (*Beitr. Path. Anat. u. Allg. Path., 32 (1902), Suppl. 5, pp. 252, pls. 13, fig. 1*).—The author undertook an elaborate investigation of the processes which are concerned in the formation of neomorphic structures in connective tissue as a result of inflammation. The experimental animals were rabbits, dogs, and pigeons, and the

method of investigation consisted in the introduction of aseptic foreign bodies into the subcutaneous connective tissue. The histological processes which are observed in the formation of the new connective tissue are described in great detail. The elements which are most important in the formation of these new tissue are the polymorphous leucocytes, fibroblasts, and polyblasts. The fibroblasts are the ordinary connective tissue cells which existed before the inflammation set in. They begin to proliferate at a very early stage of the inflammation. The polyblasts are said to play an exceedingly important rôle in the formation of the new connective tissue. They are to be characterized as amœboid wandering cells with a single nucleus.

General histological technique with special reference to the possibility of a morphological demonstration of cellular narcosis, H. Zangger (*Vrtljschr. Naturf. Gesell. Zurich, 47 (1902), No. 1–2, pp. 42–72*).—Detailed notes are given on the technique of staining animal cells by various methods with special reference to methods intended to demonstrate the presence of narcosis in various animal tissues.

Vasogen preparations in veterinary practice, A. Höijer (*Deut. Tierärztl. Wchnschr., 10 (1902), Nos. 47, pp. 449–452; 48, pp. 455–457*).—The vasogen preparations which have already been placed on the market by a firm in Hamburg number 20 or more. The author made experiments with a number of these preparations, especially in the treatment of suppurative wounds. Iodoform, iodin, pyoctanin, creolin, camphor, chloroform, creosote, and ichthyol vasogen were used, as well as mercuric vasogen salve and vasogenum purum spissum. In the author's experiments with these materials it was found that a rapid penetration and absorption took place, and the effectiveness of the preparations in inducing the process of healing was very striking. No irritation appeared to be produced by these substances upon the skin and no toxic effect was observed, whether used internally or externally.

Silver therapy, Dorn (*Berlin. Thierärztl. Wchnschr., 1902, No. 27, pp. 403–405*).—Notes are given on the use of colloidal silver in the treatment of puerperal septicemia, contagious coryza, and morbus maculosus, together with a brief account of the nature and therapeutic use of protargol and itrol.

The present status of photo-therapy and its application in veterinary practice, I. I. Neimann (*Arch. Vet. Nauk, St. Petersburg, 32 (1902), No. 12, pp. 1017–1029*).—A critical review of the literature of this subject is presented in connection with a bibliography. The author believes that light may be used under various conditions in the treament of animal diseases, and suggests apparatus and arrangement of the same for convenient use in military veterinary hospitals and similar institutions.

Treatment of malignant edema with carbolic acid, with remarks upon "leeches," or bursattee, C. F. Dawson (*Jour. Comp. Med. and Vet. Arch., 23 (1902), pp. 301, 302*).—In an operation wound made for the purpose of removing a "leech" tumor, malignant edema developed. In treating the tumor for malignant edema, injections of strong carbolic acid were used, 1 dm. being injected daily for 3 days. The formation of gas within the tumor was checked and extensive suppuration occurred for some time, with recovery of the animal after 1 month.

Accidents following upon preventive inoculation and bacterial associations, V. Galtier (*Jour. Méd. Vét. et Zootech., 5. ser., 6 (1902), Dec., pp. 697–703*).—Brief notes are given on accidental infections which may be brought about during the performance of preventive inoculation. It is believed that the association of different bacteria may aggravate the effects of vaccination made with a benign virus so that more or less serious results may attend what would otherwise have been a harmless operation.

On the relationship of human tuberculosis to that of bovines, D. J. Hamilton (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 232–278, figs. 3*).—The author discusses the difficulties of determining the possibility of transmitting bovine tuberculosis to man, and also gives brief notes on the transmission of human

tuberculosis to cattle, the problem of the unity of tubercle bacilli, the relative virulence of this organism, the criterion of infection, and Arloing's criticism of Koch's experiments.

The author's experiments were arranged in 4 series for the purpose of testing 4 methods of transmitting human tuberculosis to cattle. In the first series the animals were fed on tuberculous sputum; in the second series calves were inoculated with material from caseous cervical glands of human origin; in the third series similar experiments were made, and also experiments in the subcutaneous inoculation of tuberculous sputum, intravenous inoculation of the same, and inhalation of tuberculous sputum; in the fourth series experiments were made for the purpose of determining whether human tubercle bacilli gain in virulence by being transferred from one bovine to another.

The general conclusions drawn from these numerous experiments may be summarized as follows: Human tubercle bacilli, although not so virulent for calves as the bovine form, may nevertheless be successfully inoculated in cattle. This statement is true whether the material is derived from lymphatic glands, tuberculous lungs, sputum, or urine. Positive results in infection are obtained whether the material is introduced by way of the mouth, by subcutaneous inoculation, intravenous inoculation, or by respiring a spray containing bacilli. The lymphatic system is always involved in these cases of experimental tuberculosis, and in general the organs most affected are those nearest the point of inoculation. Tubercle bacilli of human origin when transferred to calves gain greatly in virulence by this process. The author believes, therefore, that his results favor the view that the bovine and human tubercle bacillus are identical, although somewhat differently modified by the difference in environment.

Transmission of human tuberculosis to cattle, C. O. Jensen (*Maanedsskr. Dyrlæger, 14 (1902), No. 9, pp. 527–534*).—The author presents summary accounts of a number of experiments in which different authors have succeeded in transmitting human tuberculosis to cattle.

On the infectivity of the milk of tuberculous cows, the bacteriological diagnosis, and the practical value of tuberculin in the extirpation of tuberculosis among cattle, Lydia Rabinowitsch (*Jour. Comp. Path. and Ther., 15 (1902), No. 3, pp. 209–215*).—This article is of a controversial nature and is largely occupied with a discussion of the importance of the milk from tuberculous cows as a factor in human tuberculosis. Since, in the experience of the author and many other investigators, tubercle bacilli are frequently found in the milk of tuberculous cows, it is urged that all means should be used for exterminating animals which may yield milk containing tubercle bacilli. This method includes the destruction of all animals suffering from mammary tuberculosis and a strict quarantine of animals in which a clinical diagnosis can be established only by the help of tuberculin. The time at which the latter class of animals should be killed will depend upon the rapidity of the course of tuberculosis.

Milk from tuberculous cows, J. M. Young (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 214–216*).—During the experiments reported by the author 17 among about 60 cows reacted to the tuberculin test. Among this number 4 were found to exhibit tuberculosis of the udder. From numerous inoculation experiments with the milk of these cows it was found that milk from cows affected with tuberculosis of other organs than the mammary glands possessed no virulence and was not capable of producing tuberculosis when inoculated into guinea pigs. The milk from cows suffering from mammary tuberculosis, however, was in all instances virulent and produced the disease in guinea pigs.

Should the use of the meat and milk of tuberculous animals as food be absolutely prohibited? L. del Rio (*Vet. Españ., 55 (1902), Nos. 1611, pp. 83–85;*

1612, pp. 401–404; 1613, pp. 414–416; 1614, pp. 429–431; 1615, pp. 447–449; 1616, pp. 465–467; 1617, pp. 479–481; 1618, pp. 495, 496; 1619, pp. 512–514; 1620, pp. 528–530).—The author reviews the work of the various investigators along this subject. Attention is called to the importance of meat and milk as human food and to the possible dangers to human health from the consumption of tuberculous products. Brief notes are given on the classification of meat in abattoirs according to its hygienic condition. The author believes that, as a result of these studies and experiments, tuberculosis of man and cattle are 2 forms of the same disease. Brief notes are also given on the distribution and statistics of tuberculosis.

The Public Health (Scotland) Act, 1897, and its relation to owners of stock, J. Henderson (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 63–69*).—Attention is called to the provisions of this law which relate to the sale of diseased animals and meat products. It is argued that in many instances the stock raiser may be unable to recognize the symptoms of disease and is not therefore criminally responsible for selling such animals for meat.

Cerebral tuberculosis, G. Nuvoletti (*Giorn. R. Soc. Accad. Vet. Ital., 51 (1902), No. 37, pp. 921–924*).—The author describes the gross and microscopic features of tubercles obtained from the surface of the brain in cases of bovine tuberculosis.

Extracts of tubercle bacilli and other tuberculins other than those of Koch, L. Guinard (*Rev. Tuberculose, 9 (1902), No. 3, pp. 289–319*).—The author gives a detailed description of the methods used in obtaining extracts of tubercle bacilli and producing tuberculin as practiced by Hunter, Cheyne, Klebs, Hirschfelder, Weyl, Denys, Vesely, de Schweinitz, Maragliano, von Behring, Arloing, Guinard, and Auclair.

Variations in the virulence of different cultures of turbercle bacilli, D. Veszprémi (*Centbl. Bakt. u. Par., 1 Abt., 33 (1903), Nos. 3, Orig., pp. 176–184; 4, pp. 255–259*).—The purpose of the investigations reported in the present paper was to determine whether there is in general a variation in the virulence of different cultures of tubercle bacilli corresponding to the differences in malignity of various cases of tuberculosis among human beings.

In these experiments 8 cultures were used from different human cases of tuberculosis; and from each culture material was taken for inoculation of 2 or more rabbits in the auricular vein. The amount of material used was about 3 mg. for each rabbit. Details are given concerning the effects of these different cultures on the experimental animals. It was found that tubercle bacilli in pure cultures when injected in suitable quantities into animal organisms may produce toxins which operate unfavorably upon experimental animals. These toxins are of considerable influence upon the severity of the infection. It was found also during these experiments that tubercle bacilli may indicate spontaneous degeneration and that artificial cases of tuberculosis may finally result in recovery. The tubercle bacilli in fresh cultures from different cases of human tuberculosis, especially of the pulmonary form, showed decided differences in virulence. Cultures of tubercle bacilli kept for a considerable period upon artificial nutrient media were gradually attenuated or completely lost their virulence.

It is believed as a result of these experiments that tubercle bacilli from different cases of this disease possess essentially different degrees of virulence, which may account in part for the observed differences in virulence and rapidity of extension in different cases of tuberculosis.

Treatment of parturient paresis with iodid of potash, L. Misier (*Rec. Méd. Vét., 8. ser., 9 (1902), No. 11, pp. 342–345*).—Excellent results were obtained from the use of hypodermic and intramammary injections with iodid of potash. After the administration of this chemical the author recommends the use of a hypodermic injection containing benzoate of eserin and sulphate of veratrin in water.

Treatment of parturient paresis, J. N. Ries (*Rec. Méd. Vét., 8. ser., 9 (1902), No. 15, pp. 479–480*).—Brief notes on the successful treatment of this disease with iodid of potash.

Infusion or injection in parturient paresis, J. Vlaskamp (*Tijdschr. Veeartsenijk. Maandblad, 29 (1902), No. 12, pp. 539–546*).—The author believes that this disease is due to suppression of milk secretion and that the treatment of the disease should be directed toward restoring this physiological process. The injection of potassium iodid was found to have more rapid effect than infusion of the same substance. Infusion of lukewarm water and air had no apparent effect upon the disease.

Differential diagnosis between parturient paresis and apoplectic puerperal septicemia, E. H. B. Gravenhorst (*Tijdschr. Veeartsenijk. Maandblad, 30 (1902), No. 2, pp. 81–84*).—Brief notes on the chief symptoms of these 2 diseases, which may be used in making a differential diagnosis.

Foot-and-mouth disease, J. G. Rutherford (*Canada Dept. Agr. Bul. 9, pp. 7*).—The author presents brief notes on the history of foot-and-mouth disease in Canada and the United States, together with an account of the symptoms, treatment, and methods of preventing this disease.

The apoplectic form of foot-and-mouth disease, Chapellier (*Rec. Méd. Vét., 8. ser., 9 (1902), No. 16, pp. 453–468*).—The author observed 19 cases of the apoplectic form of this disease. It was found that the animal might die suddenly while drinking and a variable quantity of liquid would be found in the trachea. In some cases the amount would be exceedingly slight. In other cases death resulted suddenly a short time after drinking. In these cases an autopsy showed that the trachea was filled with fluid. The author believes that these symptoms indicate a sudden development of an apoplectic condition in the brain. This supposition, however, is based on the symptoms only, and was not formed by an examination of the brain.

The latest recurrence of foot-and-mouth disease near Palermo, Griglio (*Gior. R. Soc. Accad. Vet. Ital., 51 (1902), No. 30, pp. 753–756*).—Brief notes are given on a recent outbreak of this disease, and also on the apparent immunity of Sicilian cattle to tuberculosis and on the successful treatment of rabies in a horse.

Baccelli's treatment of foot-and-mouth disease, A. Cinti-Luciani (*Gior. R. Soc. Accad. Vet. Ital., 51 (1902), No. 36, pp. 897–902*).—The intravenous injection of solutions of corrosive sublimate, as recommended by Baccelli in the treatment of foot-and-mouth disease was tested by the author in a number of cases. These experiments indicate that the treatment is of considerable importance in the control of the disease.

Foot-and-mouth disease and the method of Baccelli, V. Cantoni (*Gior. R. Soc. Accad. Vet. Ital., 51 (1902), No. 41, pp. 1025–1029*).—The author believes that Baccelli's remedy is perfectly reliable in the treatment of foot-and-mouth disease and that the discovery constitutes an important feature of the history of veterinary medicine.

Aspergillosis in cattle, A. Quaranta (*Gior. R. Soc. Accad. Vet. Ital., 51 (1902), No. 34, pp. 849–860*).—The author believes, as a result of a study of this disease, that aspergillosis may exist as a primary infection and that the disease may be readily differentiated from other similar diseases. In order to arrive at a thorough differential diagnosis it is recommended that the pulmonary tubercles be subjected to a microscopic examination.

Differential diagnosis of blackleg, K. D. Malinovski (*Arch. Vet. Nauk, St. Petersburg, 32 (1902), No. 12, pp. 1035–1038*).—Statistics are presented showing the distribution and economic importance of this disease in Russia. Since blackleg is most frequently mistaken for anthrax, the author presents an outline of the chief clinical symptoms and pathological lesions of these 2 diseases for the purpose of making a differential diagnosis a simple matter for practicing veterinarians.

Rinderpest in South Africa, D. Hutcheon (*Jour. Comp. Path. and Ther., 15*

(*1902*), *No. 4, pp. 300–324*).—The author discusses the origin and spread of this disease in Africa. The disease apparently spread southward from a central focus. The symptoms and post-mortem appearances are described in detail and notes are given on the ordinary means by which the disease is spread. Preventive vaccination against rinderpest has been accomplished in two ways, viz: By the way of bile, and serum, and a careful description is given of both of these methods. The use of pure fresh bile from animals suffering with the disease or from animals which have just died is the method devised by Koch and has given excellent results in practice. Another method makes use of glycerinated bile, while equally good results have been obtained from the use of preventive blood serum. The author presents notes on the curative action of this serum and on the general method of procedure in eradicating rinderpest from the herd.

Texas fever among cattle in the Netherlands, D. A. de Jong (*Tijdschr. Veeartsenijk. Maandblad, 29* (*1902*), *No. 12, pp. 531–538, pl. 1*).—A microscopic examination was made of tissues of cattle which had died with symptoms of Texas fever. No ticks were found on the cattle, but the blood parasite of Texas fever was found in the tissues of affected animals, and it was therefore concluded that Texas fever exists in the Netherlands. The origin of the infection is not known.

Cases of pulmonary and pharyngeal actinomycosis in cattle, J. Kowalewsky (*Jour. Méd. Vét. et Zootech., 5. ser., 6* (*1902*), *July, pp. 409–420, figs. 4*).—A classified table is presented of 19,084 cases of actinomycosis, arranged according to the part of the body most or primarily affected. These statistics are supplemented by further cases obtained from other countries, with special reference to the occurrence of the disease in the lungs and pharnyx.

Granulous contagious vaginitis in cows, P. Bergeon (*Jour. Méd. Vét. et Zootech., 5. ser., 6* (*1902*), *Oct., pp. 598–601*).—Brief notes on 3 cases of this disease, in one of which permanganate of potash was used, with recovery as the result in 14 days.

Experimental studies on barbone disease of buffaloes, Blin and Carougeau (*Rec. Méd. Vét., 8. ser., 9* (*1902*), *No. 20, pp. 571–586*).—According to the author's investigations of this disease it is an acute hemorrhagic septicemia due to a species of Pasteurella and common to nearly all of the countries of the extreme Orient. Notes are given on the morphology of the organism and on its behavior on various culture media. In inoculation experiments it was found that the organism was extremely virulent toward rabbits, guinea pigs, calves, adult cattle, buffaloes, dogs, and horses. Carnivorous animals were more resistant. It was found possible to immunize animals by the use of an attenuated virus. For the production of this virus the horse was found to be the most favorable animal. Notes are given on the technique of the preparation of an immunizing serum and on various methods of immunization. When small doses of virus, less than 1 cc., were inoculated simultaneously with 20 cc. of serum, a very persistent immunity was produced in cattle, calves, and buffaloes. When an injection of serum was given, followed by inoculation of virulent material, a refractory condition was likewise produced in the animal.

Barbone disease of buffalo in Indo-China, M. H. Schein (*Rec. Méd. Vét., 8. ser., 9* (*1902*), *No. 11, pp. 345–348*).—The author states briefly the differences between this disease and true cattle plague. Formerly it was supposed that the buffaloes of Indo-China were dying of cattle plague; it was found, however, that the mortality among the buffaloes was very high, while cattle were not affected. The symptoms of the disease are briefly described. It was found that the disease could be experimentally transmitted to rabbits and calves.

The pseudo-cattle plague of Indo-China, Carré (*Rec. Méd. Vét., 8. ser., 9* (*1902*), *No. 16, pp. 467–472*).—This disease, on account of its great mortality and rapid course, was for some time mistaken for true cattle plague. According to the author it is very probable that a number of contagious diseases exist among the cattle and buffaloes of Indo-China and that these diseases have not been sufficiently well studied to

permit a certain differentiation. The author found by experiment that the period of incubation of the pseudo-cattle plague was less than that of the true cattle plague, and that the diseases differed in other respects.

Bovine pasteurellosis in the Malay Peninsula, Carougeau (*Rec. Méd. Vét., 8. ser., 9 (1902), No. 18, pp. 473–486*).—As a result of the author's investigations it is concluded that the epizootic outbreaks in the Malay Peninsula are not due to cattle plague, but rather to hemorrhagic septicemia of cattle or bovine pasteurellosis. These outbreaks may appear under 3 forms—septicemic or peracute, acute with various localizations, and chronic. They are all due to the same organism, which belongs to the genus Pasteurella. This organism exhibits great variations in virulence. It was found possible to immunize animals by vaccinating them with an attenuated form of the organism. It is believed also that the data obtained from a study of the disease in the Malay Peninsula are applicable to outbreaks observed in Indo-China.

The bacillus of contagious abortion, H. Preisz (*Centbl. Bakt. u. Par., 1. Abt., 33 (1903), No. 3, Orig., pp. 190–196, figs. 4*).—The author proceeded along the lines of technique recommended by Bang in order to obtain pure cultures of this organism. The bacillus develops best in a medium consisting of agar with peptone and salt and containing a moderate amount of oxygen. The best development is obtained at a temperature of 37° C.; the optimum content of oxygen was found at a depth of from 7 to 15 mm. under the surface of the medium. The author describes in detail the behavior of this organism upon any artificial cultures. It is not stainable according to the Gram method. Experiments with female guinea pigs indicated that the organism does not cause abortion in these animals.

Abortion in cattle. Scours in new-born calves, L. Van Es (*North Dakota Sta. Bul. 54, pp. 151–167*).—The author briefly discusses 3 forms of abortion, viz, that due to mechanical injury, the form due to eating moldy food, and infectious abortion. As causes of vegetable nature the author mentions ergot, corn smut, and certain evergreen plants. Infectious abortion attacks horses, sheep, and goats, but more commonly cattle. It is believed that cows affected with the disease gradually recover. The symptoms are described in considerable detail. No medicinal treatment is known which is successful in checking the disease. Attention should be given to preventive measures, such as destruction of the fetus and after-birth and the disinfection of animals, stables, and premises. Directions are given for carrying out disinfectant measures.

Scours in calves usually appears soon after birth and has been shown to be connected with a disease of the lungs which may appear somewhat later. There is little hope of success in treating this disease by drugs, but subnitrate of bismuth, creolin, or salol may often be used with encouraging results. Attention should be chiefly directed, however, to disinfection of stables and premises.

White scour and lung disease in calves, J. D. Stewart (*Agr. Gaz. New South Wales, 14 (1903), No. 1, pp. 1–10, figs. 6*).—This disease prevails in the older dairy regions of New South Wales to a considerable extent and causes a mortality which varies from 5 to 80 per cent. White scour and lung disease are associated as in other localities where the disease has been studied. Notes are given on the usual symptoms and complications as observed by the author. In preventing the disease it is recommended that care be exercised in introducing new stock, that new calf pens be constructed, that the posterior parts of the cow be washed, and that the umbilicus be ligatured and treated with carbolized oil immediately after birth. Infected calf pens may be freed of infection by antiseptic treatment and special attention should be given to the thorough cleansing of all receptacles which are used for holding milk to be fed to calves.

Ichthyosis in calves, S. Zertzalov (*Arch. Vet. Nauk, St. Petersburg, 32 (1903), No. 12, pp. 1038, 1039*).—Brief notes are given on the symptoms which this disease usually presents, as observed in calves. The same disease occurs in man, but usually under a somewhat different form.

Diseases in sheep, W. G. Dowling (*Agr. Gaz. New South Wales, 14 (1903), No. 1, pp. 15–17*).—Strangury is reported as affecting as high as 20 per cent of rams and wethers in certain flocks of sheep. The disease appears to be contagious and it is suggested that flies may be instrumental in carrying the contagion. The treatment for severe cases is of a surgical nature and consists in the opening of the sheath and thorough treatment with antiseptic solutions.

Pasteurellosis and strongylosis of sheep, J. Lignières (*Rec. Méd. Vt., 8. ser., 9 (1902), No. 22, pp. 669–679*).—The author argues that pasteurellosis of sheep is due to the attack of a species of Pasteurella and that the disease may occur in a chronic form without the aid of an infestation by Strongylus. On the other hand the presence of these worms is favorable to the bacterial infection.

The vaccination of Algerian sheep against sheep pox, E. Nocard (*Rev. Vet. Toulouse, 27 (1902), No. 11, pp. 731–737*).—A controversial article in which the action of the French Government in its attempts to check this disease is justified.

Swine erysipelas serum, L. Deutsch (*Centbl. Bakt. u. Par., 1. Abt., 33 (1903), No. 3, Orig., pp. 214–229*).—In the author's experiments the serum for preventive inoculation against swine erysipelas was obtained from horses exclusively. The bacillus which was used in producing the serum was tested and found to be capable of producing death in pigeons when administered in doses of 1 cc. The virulence of the bacillus was increased by 12 passages through pigeons, so that finally 1 cc. of culture proved to be fatal to pigeons within from 36 to 42 hours. The author made a number of observations upon the agglutinating action of the serum. It was found that the agglutinating power is diminished by each injection of bacillus for 1 or 2 days, but gradually increases until from the eighth day on a more rapid increase in the agglutinating power takes place. When the agglutinating power of the serum unexpectedly undergoes a rapid diminution it is safe to conclude that the protective power has also become suddenly diminished. In testing the protective power of swine erysipelas serum the author considers it unsatisfactory to depend upon results obtained from the inoculation of mice. Pigeons should be used for this purpose, and the birds selected should be in good health and should weigh from 300 to 400 gm.

The control of swine erysipelas, A. van Leeuwen (*Tijdschr. Veeartsenijk. Maandblad, 29 (1902), No. 11, pp. 483–492*).—A number of experiments were made in testing methods for the control of this disease. As the result of his investigations the author concludes that the virus of swine erysipelas is generally distributed throughout the Netherlands and that preventive vaccination, so far from being useful, is actually dangerous. The author believes that the disease may be communicated to healthy pigs by the use of the vaccine. Good disinfectants and veterinary police measures are recommended in controlling the disease.

Combating swine erysipelas, J. J. Wester (*Tijdschr. Veeartsenijk. Maandblad, 30 (1902), No. 2, pp. 49–63*).—The author presents an elaborate discussion of the means of controlling this disease, with special regard to vaccination. Vaccination is said to be the most rapid method of diminishing the number of cases of swine erysipelas. It is also believed that the danger of communicating the disease by vaccination to live animals is exceedingly slight. The author urges the great value of preventive vaccination as the general measure of control. The Netherlands, however, are considered as being generally infected with the disease, and it is recognized that the bacilli of swine erysipelas are regularly found in hogs in that country.

Serum diagnosis in hog cholera and swine erysipelas, E. Ercolani (*Giorn. R. Soc. Accad. Vet. Ital., 51 (1902), Nos. 27, pp. 690–693; 29, pp. 740–744*).—The author studied the action of physical agents upon the agglutinating substances in blood serum of animals affected with hog cholera. It was found that serum maintained at a temperature of 50° C. for 2 successive days retained its agglutinating power without any change. When serum was suddenly subjected to low temperatures, its agglutinating power was stronger than when subjected for a number of days to higher temperature. As a result of the author's studies upon these subjects it is concluded

that the normal serum of experimental animals of the laboratory does not agglutinate the bacillus of hog cholera. Under the influence of a single subcutaneous injection of a culture of hog cholera bacillus the serum of hogs develops a slight agglutinating power. There is no relation between the agglutinating power of the blood serum of normal animals and the immunity or the natural susceptibility of these animals to hog cholera. There is also no connection between the agglutinating power of a serum of animals affected with hog cholera and its bactericidal power.

Prophylaxis of hog cholera, A. Cinti-Luciani (*Giorn. R. Soc. Accad. Vet. Ital., 51 (1902), No. 35, pp. 873–877*).—Attention is called to the great losses suffered among hogs as the result of this disease and to the desirability of securing some effective remedy which may be successfully employed on a large scale.

A method of vaccinating against hog cholera according to Poels, H. Anker (*Tijdschr. Veeartsenijk. Maandblad, 30 (1902), No. 2, pp. 63–80*).—The details of various methods of vaccination against this disease are discussed and the method of Poels was thoroughly tested by the author. As a result of these experiments it was found that the use of Poels's method may cause the death of healthy pigs. Vaccinated pigs may suffer from a chronic form of the disease and may die after a period of weeks or months. They may also contract the disease in an acute form. It is urged, therefore, that great caution should be observed in the use of this method since healthy pigs from 9 to 11 weeks old were found to be unable to withstand the operation.

Infectious catarrhal pulmonary inflammation in hogs, L. Greve (*Deut. Tierärztl. Wchnschr., 10 (1902), No. 52, pp. 491–493*).—A number of outbreaks of this disease were observed by the author. The incubation period appears to be about 10 to 14 days, but may be as long as 24 days. In older hogs the disease assumes a mild form, but in young pigs, 6 to 10 weeks of age, the affection is of a more serious nature. The disease may be transmitted from one animal to another by association in the same pen. During the first few days of the disease the animals cough rarely, but later the cough becomes more frequent and more violent. After a period of several weeks the symptom of coughing gradually becomes less marked, but affected animals appear never to recover entirely from the cough. During the first stage of the disease the anterior lobes of the lungs are affected to a considerable extent. A post-mortem examination and bacteriological tests furnish criteria for making the differential diagnosis between this disease and swine plague or other diseases with which it might be confused. In treating the disease it was found necessary to isolate affected animals and to keep them in warm quarters with good ventilation. The author tried 2 experiments in the use of creosote preparations in treating this disease. Creosotal was found to check the coughing in a pronounced manner within a short time. According to the author, the disease is apparently becoming less severe in localities where it has persisted longest.

Third report on surra of cattle and horses in the Protectorate of Togo, Schilling (*Centbl. Bakt. u. Par., 1 Abt., 33 (1903), No. 3, Orig., pp. 184–189, fig. 1*).—Observations were made on 7 horses affected with spontaneous cases of this disease, and it was found that Trypanosoma might be absent from the blood and organs, especially the bone marrow. Attempts to immunize horses by inoculation with blood parasites which had first been passed through dogs were without result. Similar negative results were obtained from the use of material which had been passed through both dogs and rats. The incubation period in cases of natural infection was found to be not longer than 9 days, while the course of the disease occupied from 43 days to 8 months. Two experiments were made on steers, during which blood parasites were used which had been subjected to 8 passages through both dogs and rats alternately. The previous treatment of these blood parasites did not prevent the development of acute diseases. A quite pronounced parasitic property, however, was developed in the blood serum, and it is believed that some results may be hoped for from experiments along this line. Further experiments of the same sort on cattle

and asses led the author to believe that the principle of immunization against African tsetse-fly disease has been found. In the process of immunization advantage was taken of the properties of the nagana parasites to become accustomed to the host, and in this way the virulence of the parasites toward a given species of animals was somewhat attenuated. A number of species of Glossina and Stomoxys were found, and brief notes are given upon these insects.

The American surra or mal de caderas, F. Sivori and E. Lecler (*An. Min. Agr. Argentina, Zoot. Bact. Vet. y Zool., 1 (1902), No. 1, pp. 79, pls. 51*).—The disease which passes under the name of mal de caderas has been known in different parts of South America, especially Brazil and Argentine, for a number of years. It is believed to have appeared first in the island of Marajo at the mouth of the Amazon. The earliest report concerning its ravages was made in 1860, and a number of outbreaks occurred during that time and recent years. The most serious outbreaks, however, have taken place since 1897. The authors describe in detail the symptoms of the disease as seen in spontaneous cases. Perhaps the most pronounced symptom is that of progressive anemia accompanied with irregular gait and partial paralysis of the posterior parts. There is usually an increased sensitiveness in the loins. So far as the authors have been able to observe the disease is uniformly fatal. A number of autopsies were made and detailed notes are given on the results of these examinations. The Trypanosoma, which is the cause of this disease, is closely related to those which are already known to be pathogenic for domestic animals, but is believed to be distinct from related species. Some days it may be found in large numbers in the blood, and on other days it may be entirely absent. The cause of this great fluctuation is not well understood. Notes are given on the biology and morphology of this parasite. The blood organism is able to live in shed blood for at least 4 days. Agglomeration of the parasites was observed in preparations of the blood of badly infested horses, in the peritoneum of inoculated guinea pigs, and in the blood of infected cats. The organism may be transmitted artifically to horses, mules, and various other species of mammals. The progress of the disease is rapid in rats, mice, and monkeys, while it is considerably slower in horses, cats, guinea pigs, rabbits, and dogs. In goats the disease appears to assume a chronic form, while birds and batrachia proved to be refractory. The disease appears naturally in horses and mules. The blood parasite may be transmitted by a species of Tabanus not determined, by *Musca brava*, or by species of Stomoxys. Mal de caderas is considered by the authors as being closely related to nagana and almost or perhaps quite identical with Asiatic surra.

The development of nagana and its variations according to the species of animal, A. Laveran and F. Mesnil (*Rev. Vet. Toulouse, 27 (1902), Nos. 9, pp. 569–580; 10, pp. 647–658; 11, pp. 714–728*).—The author describes in detail the symptoms of nagana as observed in rats, mice, dogs, monkeys, rabbits, guinea pigs, horses, cattle, sheep, and goats.

Trypanosoma disease other than dourine in Algeria, M. Buffard and G. Schneider (*Rec. Méd. Vét., 8. ser., 9 (1902), No. 23, pp. 721–727*).—In experiments which the authors undertook for the purpose of studying a supposed outbreak of dourine it was found that the organism with which they were working differed in its effects upon laboratory animals from that of dourine. The exact identity of the disease was not determined, but the possibility is suggested that the disease may prove to be surra.

Contribution to the serum diagnosis of glanders, M. A. Rabieaux (*Jour. Méd. Vét. et Zootech., 5. ser., 6 (1902), Aug., pp. 463–471*).—As a result of the author's investigations of this subject it is concluded that there is a marked difference between the agglutinating power of sera from glanderous and nonglanderous horses, and that this difference is sufficient to form a basis for the experimental diagnosis of glanders. Whenever the serum proves to be capable of producing agglutination when used in

a dilution of 1 to 1,000 the animal from which the serum was obtained must be considered as glanderous. This method is considered by the author to be quite technical, and it is not recommended as displacing other methods under all circumstances.

The use of antitetanic serum, A. LABAT (*Rev. Vet. Toulouse, 27 (1902), No. 9, pp. 580–586*).—The author's experiments in the use of antitetanic serum were made on horses which had received accidental or surgical wounds. Injections of this serum were made in 704 horses, 1 bull, and 1 ram. All the animals which were thus treated appeared to be protected against infection with tetanus; not a single case developed among the 706 animals. This treatment, while certain in its results, is but temporarily effective. The author believes that the immunization is not operative against the bacillus of tetanus, but merely against the toxin produced by the bacillus.

Enzootic bulbar paralysis in horses, M. H. J. P. THOMASSEN (*Tijdschr. Veeartsenijk. Maandblad, 29 (1902), No. 10, pp. 438–454, pl. 1, fig. 1*).—A number of cases of bulbar paralysis were studied by the author. Notes are given on the distribution of the disease and experiments were made to determine its etiology. These studies were without definite results, since the author was unable to determine whether the disease was due to a bacterial organism or a vegetable toxin. The author believes, however, that the disease is due to a vegetable toxin which chiefly affects the medulla.

Pulmonary filariasis accompanying summer wounds, DROUIN (*Rec. Méd. Vt., 8. ser., 9 (1902), No. 22, pp. 654–657*).—The author describes cases of this sort in horses which had been condemned as affected with glanders. Numerous tubercles were found in the lungs, which proved to be due to infestation with *Filaria irritans*.

Filaria papillosa on the serous covering of the liver and pigment deposits on the serous covering of the intestines in horses, N. VUISOTSKI (*Arch. Vt. Nauk., St. Petersburg, 32 (1902), No. 12, pp. 1046, 1047*).—A number of cases of infestation of horses with this parasite were observed and notes are given on the apparent connection between the presence of the parasite and pigmented deposits on the external walls of the intestines.

Cases of epizootic lymphangitis in the form of chronic papular conjunctivitis in horses, I. G. USENKOV (*Arch. Vet. Nauk., St. Petersburg, 32 (1902), No. 12, pp. 1039–1046*).—The author presents notes on cases of this disease in horses, giving the clinical symptoms, pathological lesions, diagnosis, and treatment. In treating the disease the author recommends local anesthesia by means of cocaine, removal of the papules, and treatment of the affected surfaces with antiseptics, such as carbolic acid.

Parasitic dermatitis, CADÉAC (*Jour. Méd. Vt. et Zootech., 5. ser., 6 (1902), Sept., pp. 520–522*).—Brief notes on a skin disease of horses, due to *Dermofilaria irritans*.

Contribution to the study of botryomycosis, V. LAFARGUE (*Rec. Vt. Toulouse, 27 (1902), No. 12, pp. 772–784*).—Notes are given on the etiology, symptoms, and various forms of this disease, which occurs in horses and other animals as well as man, and is due to *Botryomyces equi*. A detailed description is given of the symptoms and pathological anatomy observed in the acute skin form of the disease.

The sting of Bombus terrestris and the serious symptoms which it produces in horses, R. BISSAUGE (*Rec. Méd. Vt., 8. ser., 9 (1902), No. 11, pp. 337–341*).—In cases where the sting of this insect caused serious symptoms the author obtained good results from the use of subcutaneous injections of sulphate of veratrin. It is argued that the more severe symptoms can not be due entirely to the action of formic acid but that some other substance must be present in the virus of the bees.

The pathological importance of botfly larvæ in the stomach of a horse, E. PERRONCITO (*Gior. Soc. R. Accad. Vet. Ital. 51 (1902), No. 32, pp. 801–805*).—Descriptions are given of a few cases in which botflies caused the death of horses as a result of lesions produced in the stomach.

Flatworms parasitic in domesticated animals, R. S. McDougall (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 279–311, figs. 12*).—Notes on the habits, life history, and means of combating *Distomum hepaticum, D. lanceolatum, D. macrostomum, Tænia saginata, T. marginata, T. solium, T. serrata, T. echinococcus T. crassicollis, Moniezia expansa, Bothriocephalus latus,* etc.

Poisonous properties of certain species of Equisetum, C. E. J. Lohmann (*Jour. Landw., 50 (1902), No. 14, pp. 397–404*).—Feeding experiments were conducted with a number of species of Equisetum, and the results are given in detail in the present paper. Parts of the fruiting specimens of *Equisetum arvense* were fed to rabbits without producing any poisonous effects. Sterile sprouts were also fed to rabbits with negative results. *E. palustre* when fed to rabbits produced peculiar spasms and resulted in death in some cases. This species is believed to contain a nerve or muscle poison. *E. sylvaticum* was also found to be somewhat poisonous although less so than *E. palustre. E. maximum, E. pratense,* and *E. limosum* were fed to animals with negative results. Filtered extracts from *E. sylvaticum, E. arvense, E. limosum, E. pratense,* and *E. maximum* were injected into rabbits, with negative results. The explanation of these results is not understood by the author. It is believed, however, that the poisonous principles of the different species are not identical.

Permanganate of potash in the treatment of ulcerous keratitis, B. Danoy (*Rev. Vet. Toulouse, 27 (1902), No. 10, pp. 646, 647*).—Experiments were made in the treatment of 4 dogs for this disease. A solution of potassium permanganate was used in the proportion of 1 part to 2,000 of tepid water. Excellent results were obtained in all cases.

Preventive treatment for rabies in horses by means of intravenous injections of rabies virus, A. Conte (*Rev. Vet. Toulouse, 27 (1902), No. 7, pp. 434–442*).—The author treated 5 horses which had been bitten by mad dogs. The treatment consisted of intravenous injections of material obtained from the medulla of rabid dogs. In these experiments 5 cc. of an emulsion of the virus was injected into the jugular vein in each animal. Four of the animals died ultimately with pronounced symptoms of rabies. The treatment began within from 3 to 6 days after the animals were bitten. It appears, therefore, that this treatment is of little value in preventing the appearance of rabies in horses.

The histological diagnosis of rabies in dogs, A. Rabieaux (*Jour. Méd. Vt. et Zootech., 5. ser., 6 (1902), Dec., pp. 703–716, figs. 2*).—The author made extensive observations on the anatomical effects of rabies upon different organs, especially parts of the nervous system. As a result of these observations, which confirm those already published upon the same subject, the author believes that as a rule in cases of natural infection by rabies in dogs well-marked lesions are produced in the plexiform ganglia and that where these lesions are not found it may be confidently concluded that rabies was not present.

Pseudorabies of dogs, A. Tomiolo (*Gior. R. Soc. Accad. Vet. Ital., 51 (1902), No. 39, pp. 977–987*).—Inoculation experiments were made for the purpose of diagnosing an apparent case of rabies. It was found, however, that all of the symptoms of rabies were not present in an apparently rabid animal and an inoculation of 8 rabbits with brain material obtained from the suspected animal gave negative results in all cases. Notes are given on the means of differential diagnosis between true rabies and this disease.

Pseudo-tuberculosis in dogs, Ducourneau and P. Jayles (*Rev. Vet. Toulouse, 27 (1902), No. 8, pp. 501–508, fig. 1*).—A detailed account is given of the appearance and development of this disease in a dog. A post-mortem examination was made, together with bacteriological tests. It is believed that the disease is due to a pathogenic organism which gains entrance into the venous system through the vessels of

the intestines. One of the symptoms is the appearance of enteritis, which later gives place to more serious symptoms, including tympanites. The pathological anatomy of this disease is described with special reference to the condition of the liver.

Treatment of eczema in dogs by subcutaneous injections with artificial serum, PÉCUS (*Jour. Méd. Vét. et Zootech., 5. ser., 6 (1902), Oct., pp. 601–603*).—Good results are reported from the hypodermic injection of salt solutions in cases of eczema in dogs.

The effect of the injection of micro-organisms into the portal system on the sterility of the bile in the gall bladder, E. S. CARMICHAEL (*Jour. Path. and Bact., 8 (1902), No. 3, pp. 276–279*).—The author's experimental investigations were made on rabbits, the micro-organisms being coli bacillus and Streptococci. Typhoid bacilli were also used on 1 animal. It was found that, in all these experiments except one, in the injection of micro-organisms into the portal system in quantities varying from 5 minims up, the bile retained its normal condition, thus indicating that micro-organisms can not pass through the normal hepatic tissue. Animals injected with *B. coli communis* and killed within 12 hours after the injection were found to possess absolutely sterile bile.

An epizootic among guinea pigs caused by a variety of coli bacillus, K. KOVÁRZIK (*Centbl. Bakt. u. Par., 1. Abt., 33 (1903), No. 2, Orig., pp. 143–149*).—An outbreak of an epizootic nature occurred among the guinea pigs used for experimental purposes in the veterinary high school at Budapest. An investigation of the subject disclosed the fact that this disease was due to infection with a bacillus of the coli group. Notes are given on its growth and behavior on various culture media. Inoculation experiments were made on a number of animals. The organism was found to be pathogenic for rabbits, pigeons, guinea pigs, and sparrows. Dogs proved refractory. The bacillus was not destroyed by heat for 1 hour at a temperature of 60° C. A bibliography of the literature of this subject is appended to the article.

A new micro-organism which causes infection in animal pens, SCHWER (*Centbl. Bakt. u. Par., 1. Abt., 33 (1902), No. 1, Orig., pp. 41–47, figs. 2*).—A study was made of an infectious disease which broke out among guinea pigs and other experimental animals in a laboratory. It was found that this organism produced an infectious disease of very rapid and fatal course. The clinical symptoms were therefore not very well defined. The post-mortem findings were, however, quite characteristic. The liver and spleen were greatly enlarged and exhibited extensive necrotic foci. The lungs were hyperemic and extensive microscopical alterations were produced in various organs. Notes are given on the appearance of the organism and its behavior on various culture media. It was found to be pathogenic for guinea pigs, rabbits, and mice, and appears to be most closely related to the bacillus of fowl cholera.

Determination of the value of fowl cholera serum, F. H. MOSLER (*Centbl. Bakt. u. Par., 1. Abt., 33 (1903), No. 3, Orig., pp. 230–235*).—A number of cultures of fowl cholera bacillus were utilized in these experiments and the experimental animals were chickens and mice. It was found that in the use of a culture of fowl cholera bacillus so virulent that 2 loops of the material would kill a mouse weighing 20 gm. within a period of 24 hours, a prophylactic effect could still be produced by the antiserum of Jess and Piorkowski, even if this serum had been kept for a period of 1 year.

MISCELLANEOUS.

Fifteenth Annual Report of Colorado Station, 1902 (*Colorado Sta. Rpt. 1902, pp. 75–218*).—This includes the organization list; a financial statement for the fiscal year ended June 30, 1902; a report of the director on the work of the station and substations, including a subject list of station publications; an inventory of station

equipment; a list of exchanges; and departmental reports, parts of which are noted elsewhere. Brief reports of the field agents and of the work done at the Plains Substation are also included.

Fifteenth Annual Report of Illinois Station, 1902 (*Illinois Sta. Rpt. 1902, pp. 16*).—This includes an enumeration of the principal lines of station work, a list of station publications, and a detailed financial statement for the fiscal year ended June 30, 1902.

Special Report of Illinois Station, February, 1903 (*Illinois Sta. Spec. Rpt. Feb., 1903, pp. 405*).—This report is made up of publications of the station relating to the live-stock, corn, soil, horticultural, dairy, and sugar-beet investigations which have been carried on by the station for nearly 2 years under State appropriations. Results obtained along the different lines are briefly summarized, suggestions are made as to future work, and a financial statement is included. More detailed progress reports, issued as Circulars 62–67, and noted elsewhere in this issue, are also made on the lines of work mentioned. The regular bulletins of the station included are Nos. 73–78 and 82–84.

Tenth Annual Report of Minnesota Station, 1902 (*Minnesota Sta. Rpt. 1902, pp. XIX + 265*).—This includes the organization list of the station; a report of the director containing a financial statement for the fiscal year ended June 30, 1902, and a review of the different lines of station work; a reprint of Class Bulletin 12, entitled Outline of Greenhouse Laboratory Work (E. S. R., 14, p. 870), and reprints of Bulletins 73–76 of the station on the following subjects: Growing swine of various breeds and crosses (E. S. R., 14, p. 284); human food investigations (E. S. R., 14, p. 274); fattening lambs (E. S. R., 14, p. 796); and fattening steers (E. S. R., 14, p. 794).

Fourteenth Annual Report of New Hampshire Station, 1902 (*New Hampshire Sta. Bul. 96, pp. 109–140*).—This includes the organization list of the station, a financial statement for the fiscal year ended June 30, 1902, reports of the vice-director and heads of departments, parts of which are noted elsewhere, a summary of meteorological observations, and a list of station publications available for distribution.

Director's report for 1902, W. H. Jordan (*New York State Sta. Bul. 229, pp. 457–471*).—This is a report of the director upon the work of the station during the year. Notes are given on the station staff, mention is made of needed equipment, the results of fertilizer and feeding stuff inspection during the year are briefly summarized, and station work along the lines of bacteriology, botany, entomology, and horticulture is outlined. A list of bulletins published in 1902 is appended.

Twenty-fifth Annual Report of North Carolina Station, 1902 (*North Carolina Sta. Rpt. 1902, pp. 118*).—This includes the organization list of the station; reports of the director and heads of departments on the work of the station during the year; a financial statement for the fiscal year ended June 30, 1902; several miscellaneous papers noted elsewhere in this issue, and reprints of press bulletins on the hair snake (*Gordius variabilis*) and cotton anthracnose, and of Bulletin 181 of the station on silk culture (E. S. R., 14, p. 784).

Fifteenth Annual Report of Vermont Station, 1902 (*Vermont Sta. Rpt. 1902, pp. 193–352 + XXXVIII*).—This includes the organization list of the station; an announcement concerning the work undertaken by the station; a financial statement for the fiscal year ended June 30, 1902; a report of the director, containing a list of available station publications and a brief discussion of the relation of the station to the public and to the State; abstracts of Bulletins 88–91, and departmental reports abstracted elsewhere.

Reports of the agricultural experiment stations in Austria (*Ztschr. Landw. Versuchsw. Oesterr., 6 (1903), No. 4, pp. 395–536*).—This includes reports of the following institutions for 1902: Agricultural experiment station for plant culture,

Brünn; experiment station of the Lower Austrian agricultural, horticultural, and viticultural school, Feldsberg; agricultural chemical experiment and seed control station, Gratz; seed control station of the agricultural secondary school, Kaaden; agricultural chemical experiment station of the Royal Imperial Agricultural Society of Carnithia, Klagenfurt; agricultural chemical experiment station for Carniola, Laibach; agricultural experiment station, Lobositz; agricultural chemical experiment station, St. Michael-on-the-Etsch, Tyrol; agricultural chemical experiment station of the agricultural council for Upper Austria, Otterbach, near Schärding; agricultural physiological experiment station of the Bohemian section of the agricultural council for the Kingdom of Bohemia at the Royal Imperial Bohemian Technical High School, Prague; experiment station for the brewing industry in Bohemia, Prague; experiment station for the sugar industry, Prague; Royal Bohemian Agricultural Academy, Tetschen-Liebwerd; experiment station for flax culture and the manufacture of flax products, Trautenau; agricultural botanical experiment and seed control station, Troppau, and agricultural botanical experiment station, Tabor.

Crop Reporter (*U. S. Dept. Agr., Division of Statistics Crop Reporter, Vol. 4, Nos. 10–12, pp. 8 each*).—These numbers are made up as usual of statistical information on the condition of crops in the United States and foreign countries, and are the issues for February, March, and April, 1903.

Our foreign trade in agricultural products, 1902, F. H. Hitchcock (*U. S. Dept. Agr., Division of Foreign Markets Circ. 25, pp. 24*).—This is issued as a supplement to Bulletin 27 (E. S. R., 14, p. 304), and gives statistics on the imports and exports of the United States during 1902. As compared with 1901 the agricultural imports increased from $391,931,051 to $413,744,557 and the agricultural exports decreased from $951,628,331 to $857,113,533.

The cotton-oil industry in America, D. A. Tompkins (*Cassier's Mag., 24 (1903), No. 1, pp. 45–54, figs. 10*).—The history and the present status and importance of the industry are discussed. The article contains a diagram showing the cycle of production, consumption, and land restoration in case of cotton.

Utilization of wood waste, E. Hubbard, trans. by M. J. Salter (*London: Scott, Greenwood & Co., 1902, pp. XVI+192, figs. 50*).—This is a translation of the second, revised and enlarged, German edition of this work, which contains, besides general remarks on the utilization of sawdust, chapters dealing with the use of sawdust as fuel with and without simultaneous recovery of charcoal and the products of distillation; the manufacture of oxalic acid, ethyl alcohol, dyes (organic sulphids and mercapto dyes); artificial wood and plastic compositions and wood compositions for molded decorations from wood waste; the employment of sawdust in the preparation of blasting powders and gunpowders, in briquettes, in the ceramic industry as an addition to mortar; the manufacture of paper pulp from wood; the production of wood wool, and miscellaneous applications of sawdust and wood refuse.

Unirrigated lands of eastern Colorado, J. E. Payne (*Colorado Sta. Bul. 77, pp. 36, figs. 4*).—The results of observations made by the author during 7 years' study of the soil, climate, natural vegetation, water supply, settlement, cultivated crops, and live stock industry of the Great Plains of eastern Colorado are recorded. "Stock raising must be the basis of all successful agricultural efforts in this region, and crop raising should be generally attempted as an aid to stock raising."

The Bermuda Islands; an account of their scenery, climate, productions, physiography, natural history and geology, with sketches of their discovery and early history, and the changes in their flora and fauna due to man, A. E. Verrill (*New Haven, Conn.: Author, 1902, pp. X+548, pls. 90, figs. 182*).—The purpose of this volume is to give a convenient and comprehensive account of the history, natural features, and productions of the islands. It is intended for the use of tourists, students, and the inhabitants of the islands. The subjects considered

include general description, physiography, principal productions, exports, and changes in the flora and fauna due to man. The last-named part of the volume is further subdivided and contains a discussion of the character and origin of the native flora, the effects of deforesting, the introduction of useful plants, injurious weeds, and various species of animals, and the extermination of native birds. Especial attention is devoted to a discussion of the insects found in the Bermuda Islands. Among the numerous species of insects many of the more injurious pests common to the United States are noted. The parts of this volume dealing with climate and soils are noted elsewhere.

The Iowa yearbook of agriculture, J. C. Simpson (*Iowa Dept. Agr. Yearbook, 1902, pp. 764, pls. 20, figs. 57*).—This volume contains extracts from the Iowa road laws, an account of the State farmers' institute and agricultural convention and of a meeting of the State board of agriculture in 1902, together with a weather and crop report and the reports of the State college and of the State Dairy Commission. The proceedings are reported of the Improved Stock Breeders' Association, the Iowa Swine Breeders' Association, Iowa Dairy Association, and Iowa Park and Forestry Association. Notes are also given on various farm crops and live stock, statistics of the farms, crops, live stock, reports of county and district societies, and copies of a number of papers read before farmers' institutes.

Eighth report of the Bureau of Agriculture, Labor, and Industry of the State of Montana, J. A. Ferguson (*Helena, Montana: Bureau Agr., Labor, and Ind., pp. VIII–733, pls. 30, figs. 82*).—A brief historical and descriptive account of Montana is presented, together with a discussion of the land, agricultural industries, live stock, labor, mines, various new industries, and miscellaneous matters relating to population, markets, assessed valuation, taxes, municipal ownership, libraries, sociological investigations, etc. Among the new industries special mention is made of various mining enterprises, the preservation of railroad ties, manufacture of macaroni, and development of oil fields.

Agricultural education in Hungary, J. Speir (*Trans. Highland and Agr. Soc. Scotland, 5. ser., 15 (1903), pp. 33–52, figs. 12*).—This is a general account of the development and present status of agricultural education in Hungary. There are at present 3 grades of institutions giving instructions in agriculture, viz, agricultural colleges at Magyar-Ovár and Debreczen; intermediate schools at Keszthely, Kassa, and Kolozsvar, and 21 farm schools. There are also 11 itinerant instructors in agriculture.

List of national, State, and local commercial organizations, and national, State, and local agricultural associations (*Washington: Govt. Printing Office, 1903, pp. 296*).

NOTES.

ARKANSAS STATION.—R. L. Bennett, director of the station since 1890, has resigned to go into private business. He left the station June 30.

COLORADO COLLEGE AND STATION.—W. L. Carlisle, professor of animal husbandry in the Wisconsin University and Station, has been elected agriculturist of the college and station and will take up his new duties in the fall. H. H. Griffin, field agent for the Arkansas Valley, located at Rocky Ford, has resigned to enter the employ of a sugar-beet company and has been succeeded by P. K. Blinn. The latter has charge of the cooperative experiments which the station is carrying on with the farmers in the valley, and is studying its agricultural development. The station at Rocky Ford has been rented to a progressive farmer, who is a graduate of the college, with the understanding that he will conduct experiments along certain lines without expense to the station.

FLORIDA UNIVERSITY.—The last legislature gave the university about $60,000 for maintenance for the biennial period. The appropriation for buildings was declared unconstitutional in the form in which it passed. The veterinarian of the university and station was made ex officio State veterinarian. H. G. Dorsey, assistant professor of physics, has resigned to accept a position in a Rochester, N. Y., institution. The board at its last meeting abolished coeducation at the university.

HAWAII STATION.—Press reports state that the agricultural appropriations made by the Territorial legislature, which amounted as passed to $41,600, includes $7,500 in aid of the Federal experiment station.

IDAHO STATION.—J. S. Burd, assistant in the Bureau of Chemistry of this Department, has been appointed chemist to the Idaho Station, vice H. B. Slade who severed his connection with the station several months ago. Mr. Burd entered upon his duties July 1.

IOWA COLLEGE AND STATION.—F. R. Marshall, assistant in animal husbandry, has resigned his position to take charge of the live-stock work at the Brookmont Farm, Odebolt, Iowa, where the station has carried on extensive cooperative feeding experiments. He has been succeeded by W. J. Rutherford of Guelph, Canada.

KENTUCKY STATION.—Hon. F. A. Hopkins, Prestonburg, has been appointed a member of the board of trustees to succeed J. B. Marcum, deceased, and Dr. T. Carpenter, Scottsville, has been appointed to succeed B. W. Bradburn, resigned. D. W. May has been granted leave of absence during August and September and will spend the time in England and Scotland studying live-stock and breeding interests in those countries. George Roberts, assistant chemist, has resigned to accept a position in the chemical department of the California Station, in charge of the fertilizer control provided for by the recent act of the legislature of that State.

MAINE UNIVERSITY AND STATION.—At a recent meeting of the trustees of the university it was voted to establish a secondary school in agriculture with a two-years' course, entirely distinct from the college courses. The school will open the coming fall. It will consist of a fall, spring, and summer term the first year, and a fall and spring term in the second year, making a total of five terms aggregating sixty-two weeks. S. C. Dinsmore, a graduate of the university in the class of 1903, has been elected chemist, vice E. R. Mansfield, resigned.

MARYLAND COLLEGE AND STATION.—James S. Robinson, horticulturist, has retired from active charge of the horticultural work in the college and station, but will retain a nominal connection with the institution. M. M. Strong, M. S., has been elected assistant chemist to the station. Mr. Strong is a graduate of the Maryland college and has been for several years an assistant in the fertilizer inspection, but has spent the past year in special study at Johns Hopkins University.

MASSACHUSETTS COLLEGE AND STATION.—Francis Canning nas been appointed instructor in floriculture and will have charge of the greenhouses. Neil F. Monahan, a graduate of the college, has been appointed assistant in the botanical department of the station, and G. F. Freeman, of Alabama Polytechnic Institute, assistant in the inspection work in botany, vice R. E. Smith. A general revision of the course of study has been made which will go into effect at the beginning of the new college year. Electives are offered during both the junior and senior years. The State board of agriculture has recently issued a special report by C. H. Fernald and A. H. Kirkland, on the brown-tail moth, which is now doing so much damage to fruit and shade trees in the eastern part of the State.

MISSOURI COLLEGE AND STATION.—H. J. Waters, dean and director, has been appointed superintendent of agriculture for the Missouri exhibit at the St. Louis Exposition and has been granted a leave of absence to take up this work. F. B. Mumford has been appointed acting dean and director in his absence. An addition is to be built to the new horticultural building, which is now occupied by the departments of horticulture, entomology, and botany. The addition will be used for experimental work in botany along physiological, pathological, and ecological lines. A feeding shed 300 feet long and 30 feet wide is being built. This is intended primarily for the large feeding experiment which is being conducted in cooperation with the United States Department of Agriculture.

MONTANA COLLEGE AND STATION.—Samuel Fortier, director and irrigation engineer, has been granted leave of absence from the college and station for one year and has assumed charge of the irrigation work of this Office which is being carried on in California in cooperation with the State and the University of California.

NEBRASKA UNIVERSITY.—Frank G. Miller of the Yale School of Forestry has been elected professor of forestry.

NEW HAMPSHIRE COLLEGE AND STATION.—The State legislature has appropriated a total amount of $40,000 for the college, $15,000 of which is for general expenses, $13,000 for equipping the new agricultural and horticultural building, $7,000 for a greenhouse, and $5,000 for additions to the heating plant. Edith M. Davis has been appointed purchasing agent of the college and clerk of the station in the place of F. C. Keith.

NEW YORK STATE STATION.—Milo H. Olin of Perry and Irving Rouse of Rochester have been appointed on the board of control, to succeed Oscar H. Hale and M. L. Allen, whose terms expired; and C. W. Ward of Queens, to succeed E. A. Callahan, deceased. The cattle barn, constructed to replace the one which was destroyed by fire last year, has been completed and the remodeled administration building is being occupied. Plans are under way for a new horse barn for which an appropriation of $5,000 was made by the last legislature, and for a fire protection system to cost $5,000.

CORNELL UNIVERSITY.—Owing to the failure of the State to appropriate means for the maintenance of the college of forestry, established by the State at Cornell University, the trustees of the university have decided to suspend instruction in that college until the means for its maintenance are provided by the State, and have declared all positions on the instruction force, including that of director, vacated. There was a prospect of an attendance of about one hundred students at the school next fall.

OHIO UNIVERSITY AND STATION.—Thomas F. Hunt has resigned his position as dean and professor of agriculture in the university, to become professor of agronomy at Cornell University. He entered upon his new position July 1. H. C. Price, a graduate of the university and recently horticulturist at the Iowa College and Station, has veen elected dean and professor of rural economics, and M. F. Miller has been made assistant professor of agronomy. John F. Hicks, assistant botanist at the Ohio Station, was shot by an unknown person just as he was preparing to leave Wooster the night of May 31. Mr. Hicks had resigned his position to engage in business in Cleveland.

OKLAHOMA COLLEGE AND STATION.—J. F. Nicholson, of the New York State Station, has been appointed assistant in bacteriology in the college and station. Provision has been made for the appointment of an assistant in agriculture. C. O Pearcy, clerk and stenographer, has resigned.

PENNSYLVANIA COLLEGE.—The total appropriation for the college made by the State legislature at its recent session was $250,805.55. Of this amount $100,000 is for the purpose of assisting in the erection, equipment, and furnishing of a building for the department of agriculture of the college, while $150,000 additional is virtually pledged by the attachment of a proviso requiring the trustees of the college to file with the auditor-general plans, specifications, and estimates satisfactory to him showing that the entire cost of the building and equipment will not exceed $250,000. At no stage in the progress of the bill through the legislature was a single vote recorded against it. The amount was voluntarily increased by the appropriation committee from $223,000 to $250,000. The college announces the resumption of the short course in agriculture, which has been suspended for the past four years. The course next winter will begin January 6 and continue until March 30. The short creamery course will begin at the same time and close March 2.

SOUTH CAROLINA COLLEGE AND STATION.—The board of trustees has voted to erect an agricultural building to cost $50,000, providing full accommodation for the agricultural department and its various divisions. J. S. Newman has been appointed director of farmers' institutes. It was planned to hold thirty-one local institutes during the month of July, and a State institute to be held at the college August 10 to 14.

UTAH COLLEGE AND STATION.—G. L. Swendsen, professor of civil engineering and hydraulic engineer to the station, has resigned to accept an appointment with the U. S. Geological Survey. W. M. McLaughlin, a graduate of the college in 1895, has been appointed his successor in the station, and will give his whole time to the station work. W. D. Beers, assistant irrigation engineer, has severed his connection with the college and station. In accordance with the recent provision of the State legislature 6 farms have been located by the station in different parts of the State for experiments in dry farming. These include 40 acres each, and were donated in each case by the county, which also paid the expense of clearing and fencing them. No buildings or permanent equipments will be provided, the team work being hired. A competent laborer will be placed in charge of each farm, and the station will exercise a close supervision of the work. Trials will be made mainly with grains and forage crops grown without irrigation.

VERMONT STATION.—F. M. Hollister, B. S., of the class of 1903, has been appointed assistant chemist.

WASHINGTON STATION.—The State Station at Puyallup has been closed and the land rented to local parties who will look after the plants and fruits now growing. The legislature passed an appropriation of $12,000 for the station, but the bill failed to receive the governor's signature.

WEST VIRGINIA COLLEGE AND STATION.—John L. Sheldon, of the botanical depart-

ment of the University of Nebraska, has been appointed professor of bacteriology in the university and station, and will enter upon his duties September 1.

Florida Agricultural Institute.—The legislature of the State of Florida at its recent session provided for the establishment of an agricultural institute, for practical instruction in that subject, to be located at Kissimmee. An appropriation of $5,000 was made for establishing the institute, and $5,000 for its maintenance for two years.

California Polytechnic School.—The first annual catalogue of this new school has recently been received. The State legislature in 1901 appropriated $50,000 for the establishment of the school, and it was located on a 280 acre tract of land near San Luis Obispo. The past winter the legislature appropriated $64,400 to complete the buildings undertaken, and for equipment and maintenance during the biennium. It is distinctly stated that the institution will not be of the college grade, and will not aim to prepare students to enter a higher institution of learning. "Its course of study is arranged solely in view of the needs of the boy and girl who are going to earn a livelihood after completing its course." This covers three years. The work of the first two years is prescribed for all students, and includes both agriculture and mechanics for the boys and domestic science for the girls. The third year about one-half the course is elective. The instruction will be both theoretical and practical, and much of the work on the farm and in erecting frame buildings for the farm will be done by the students. Two buildings, an admission building and a dormitory, each having two main floors and a high basement, are approaching completion. The school will open in September, and the prospects for the entering class are already good. The director, it will be remembered, is Dr. Leroy Anderson, formerly of the New York Cornell Station, and more recently of the California University and Station.

Japanese Experiment Stations.—The successful work of the local agricultural experiment stations in Japan has made it possible for the Ministry of Agriculture and Commerce to reduce the number of branch experiment stations connected with the Central Agricultural Experiment Station at Nishigahara, and to concentrate its efforts and funds on a smaller number of stations and fewer lines of work. Until April, 1903, there were 9 of these branch stations, but at that time 6 of them, viz, the Hokuriku, Too, Tokai, Shikoku, Sanio, and Sanin branch stations, were turned over to the control of the local governments, and the funds and staffs of these institutions were transferred to the Central Agricultural Experiment Station, and the 3 remaining branch stations, i. e., those at Kashiwabara, Idzumimura, and Hanadatemura. The funds available for the Central Station and its 3 branches for the fiscal year ending March 31, 1904, amount to $91,920. The total budget of the Ministry of Agriculture and Commerce for the same year is $3,386,713. The local stations referred to above now number 39. They receive subsidies from the Ministry of Agriculture and Commerce amounting to $65,000 a year and also funds appropriated by the local governments. The annual expenditures of these stations vary from $2,200 to $11,232. In addition to the stations supported by public funds, there are 3 private experiment stations. The island of Formosa supports 3 agricultural experiment stations and a tea experiment station, all of which are under the control of the Bureau of Industries of Formosa.

Tour of the German Agriculturists.—The party of forty-four gentlemen, mostly landowners and members of the German Agricultural Society, who had been on a tour of this country since May 2, concluded their trip in New York June 24. The party visited points of agricultural interest in eighteen different States, and traveled for that purpose about 11,000 miles. At the request of the German Agricultural Society the itinerary of the trip had been arranged in this Department, and Mr. J. I. Schulte, of this Office, accompanied the party as conductor. A slight change was

made to allow the visitors to go through the Yellowstone National Park, which was not originally included in the instructions from the society.

Considering the prominence of the gentlemen composing the party, and their intelligence in matters pertaining to agriculture, their impressions are interesting. In general it may be said that they found much to approve and admire, and that their criticisms were frank and fair minded, although they often failed to take into consideration the local conditions which prevail in this country. They commented very favorably upon the work of this Department in general, and especially approved its efforts to solve the practical problems of immediate interest to agriculture. The wide distribution of information by the Department strongly appealed to them.

Agricultural colleges and experiment stations were inspected in Kentucky, Iowa, California, Oregon, Minnesota, and Wisconsin. These institutions were considered well equipped for imparting scientific and practical knowledge, and consequently looked upon as one of the greatest factors in the rapid development of American agriculture. The methods of teaching stock judging met with hearty approval, and some of the party expressed themselves in favor of more rapid development of this feature of agricultural instruction in their own schools. As might have been expected, the military instruction given at the agricultural colleges proved of much interest. Exhibition drills were given at the Iowa and Oregon colleges, and the work of the cadets was commended.

Some surprise was expressed that in building up a dairy herd the American farmer evidently considers practically only the milk and butter production, while in Germany considerable attention is given to making the individuals of a herd alike in color and in form. The large milk and butter records called to their attention were generally looked upon with suspicion. The method of stabling cows in stalls with short floors and in stanchions was not approved of, although it was conceded that the animals might be kept more clean; this, however, at the sacrifice of comfort.

In studying horse raising and breeding, the greatest interest was exhibited in the breeds of distinctively American character, such as the Kentucky thoroughbred and the standard-bred horses. The desire of the visitors in general was not so much to see fine stallions or be impressed with track records, as to find out how the colt is reared, broken, and sold; how much it costs to produce a horse, and what is realized for him when placed on the market. In looking over draft horses, their interest was centered less on imported animals than on the generations produced on American soil and under American management.

The beet-sugar industry was an object of much interest, and they were favorably impressed with what they saw of the beet fields and factories; but considering the labor and other economic conditions in this country, the opinion prevailed that Germany presents certain advantages and that the competition of this country is likely to prove less serious than has been anticipated.

The agriculture, horticulture, and forestry of the Pacific Coast States received in general most favorable comment. That section of our country impressed itself upon the foreign visitors largely through its diversity in products and its fine tree growth. The reclamation of the "tule" lands in California proved of highest interest.

Perhaps the deepest impression was made by our forest conditions. The unanimous verdict of the party was that our management of the trees was extremely wasteful. Many were of the opinion that the day when the United States will import lumber is bound to come soon unless a radical change in our methods is made in the near future. The many fallen timbers and the evidences of comparatively recent forest fires in the Yellowstone Park were an eyesore to the party, and made it impossible for them to fully enjoy one of our greatest natural attractions.

The general conclusion of the visitors was that while they had seen many interesting features of agriculture in the United States, and were highly impressed with its rapid development and progress, the conditions here were so different that very few of our methods were directly applicable to agriculture in Germany.

Economics of Farm Management.—The first part of a Syllabus of Lectures on Agricultural Economics, by Dr. Henry C. Taylor, of the University of Wisconsin, has been received. This first part is devoted to the economics of farm management, and is based upon a course of lectures delivered by the author during the past winter to the second-year short-course students in the college of agriculture. Following the introductory, there are chapters on crops and field systems—European and American, intensity of culture, productivity, the size of farms, prices of agricultural products, distribution of gross returns, the price of land, land tenure in the United States, means of acquiring land ownership, and the renting of land. "The writer makes no pretensions of having presented here a complete outline of the subject. The needs of the students and the material which the author had in hand determined the character of the course of lectures. Practically all of the time has been given to private agricultural economics, because the subjects included under this head are of more immediate interest to the farmer. The author hopes to find time to work this subject out much more completely in the near future."

Miscellaneous.—Elwood Mead, in charge of irrigation investigations of this Department, has gone to Italy for the purpose of making a study of the methods of distributing and using water in that country, and the kinds and value of crops grown by irrigation. The annual rainfall in Italy being nearly 40 inches makes irrigation a matter of choice rather than of necessity, and gives the results a significance to irrigators in the eastern part of the United States which irrigation in arid countries like Egypt does not have. Mr. Mead will spend a month or more in the valley of the Po studying the irrigation systems in Lombardy and Piedmont. He will ascertain, if possible, how rivers are controlled, either by the State or by private interests, and will gather statistics of the prices paid for water, the amounts used, the way in which it is applied to crops, and the differences in products, yields, and value on irrigated and unirrigated land. In connection with his trip Mr. Mead will make briefer observations of irrigation in Switzerland and possibly southern France and Spain. If his time permits he will inquire into what is being done in the application of power to farm work, in the pumping of water and in irrigation and drainage, and what the agricultural experiment stations are doing to determine the efficiency of agricultural machinery.

Prof. W. O. Atwater, in charge of nutrition investigations of this Office, has gone to Europe, where he will spend the summer and fall in studying the progress of investigations on human nutrition in the leading laboratories and other institutions of England, France, Belgium, Switzerland, Italy, Austria, Germany, and, perhaps, Denmark and Sweden. He expects to return about the end of November.

Gifford Pinchot, Chief of the Bureau of Forestry of this Department, has been elected professor of forestry in the Yale Forest School. This appointment will make no change in his relation to the Bureau of Forestry, and will but slightly increase the work he has been doing for the school in the past. He will deliver a short course of lectures at New Haven during the first two weeks of November.

Prof. William H. Brewer has resigned the professorship of agriculture at the Sheffield Scientific School, Yale University, and has been appointed professor emeritus. The university conferred the degree of LL. D. upon him at the recent commencement.

Luther Burbank, of Santa Rosa, Cal., was awarded a gold medal by the California Academy of Sciences on the recent occasion of the celebration of its semicentennial anniversary. This was the highest honor conferred by the academy, and was awarded to Mr. Burbank for "meritorious work in developing new forms of plant life."

Prof. Thomas F. Hunt has received the degree of Doctor of Agriculture from the University of Illinois.

W. C. Welborn, formerly of the Mississippi Agricultural and Mechanical College, has gone to the Philippines, where he will be connected with the Bureau of Agriculture.

T. D. A. Cockerell, of the Normal University, at East Las Vegas, N. Mex., and consulting entomologist of the Arizona Station, has accepted a position in Colorado College, at Colorado Springs.

Harvard University has established a course in forestry, and R. T. Fisher has been appointed instructor in this subject.

We note from *Science* that L. Daniel has been elected to a newly established chair of agricultural botany at the University of Rennes.

The American Association of Farmers' Institute Workers held its annual meeting at Toronto June 23–26. The officers elected for the coming year were: President, B. W. Kilgore, of North Carolina; vice-president, E. E. Kaufman, of North Dakota; secretary, G. C. Creelman, of Ontario; executive committee, the president, secretary, and George McKerrow of Wisconsin, H. C. Easterly of Illinois, and J. C. Hardy of Mississippi. The meeting next year will be held at St. Louis.

The Seventh Annual Convention of the National Association of State Dairy and Food Departments was held at St. Paul July 21–24. The programme was a long one and included papers and discussions on food legislation, food standards, manufacture and preservation of foods, antiseptics, labeling, etc.

A bill has passed the State legislature of Massachusetts providing for the manufacture of vaccine lymph for free distribution in the State and placing this under the control of the State board of health. The lymph will be manufactured at the Bussey Institute. A bill appropriating $250,000 for combating the gypsy moth has been rejected.

We note from *Nature* that the annual report of the Royal Agricultural Society, adopted at the meeting held May 22, states that the council of the society has decided to organize an agricultural education exhibition as a new feature of its annual show, with a view to bringing before the public the general characteristics of the teaching now provided at agricultural colleges, and of drawing attention to the society's own share in this work as a national examining body.

The board of agricultural studies of the University of Cambridge reports that during the past year 169 students have received instruction in agricultural science. The income of the department is about $18,000. The need of a permanent building to accommodate the various branches of this work is becoming apparent and the matter is receiving the consideration of the board.

It is reported that the Viceroy of India will devote the £20,000 donated by Henry Phipps to the establishment of a laboratory for agricultural research, to be known as the Phipps Laboratory, and to be situated at Dehra Dun, and to a second Pasteur institute in the south of India. The donation will be devoted to providing the buildings. The government will contribute toward the maintenance of the agricultural laboratory and bear the whole expense in the case of the Pasteur institute.

Abattoirs in Europe, U. S. D. A. ... 685
Abies balsamea, canker ... 462
nobilis, notes ... 453
venusta, in California ... 362
Abortion, contagious, bacillus of ... 1124
notes ... 190, 816, 920
treatment ... 920
in cows ... 612, 920
N. Dak ... 1124
N. J ... 611
dogs ... 920
mares ... 924
Abutilon, culture ... 236, 432
Acacia koa in the Hawaiian Islands ... 451
spp., descriptions ... 420
Acacia, rate of growth in Ceylon ... 766
Acacias, notes, Cal ... 256
tan bark, analyses, Cal ... 712
Acanthocerus galeator, notes, U. S. D. A. ... 166
Acarus farinæ, detection in flour ... 786
Acarus, injury to oranges ... 459
Acetylene gas lamp for destroying insects ... 170
gaslight, effect on plants ... 421
N. H. ... 860
Acid phosphate. (*See* Superphosphates.)
Acidity, determination in bread ... 477
gluten feeds ... 112, 224
milk and cream, Wis ... 1010
soils ... 111, 418
tanning liquors ... 116
testing in milk with litmus paper ... 545
Acids, distribution in plants ... 420
free fatty, character ... 545
function in cheese making, N. Y. State ... 607
nonvolatile, determination in butter ... 1043
organic, in tropical fruits ... 8
Acorn poisoning of cattle ... 397
Acridium pupuriferum, notes ... 465
Actinobacillosis, studies ... 498
Actinomyces, organisms resembling ... 397
studies ... 189
Actinomycosis in cattle ... 916
occurrence in Australia ... 186
Canada ... 1117
Massachusetts ... 186
organisms ... 189, 916
pathology ... 88

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The Editor and H. W. Lawson.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. Beal.
Botany and Diseases of Plants—Walter H. Evans, Ph. D.
Foods and Animal Production—C. F. Langworthy, Ph. D.
Field Crops—J. I. Schulte.
Entomology and Veterinary Science—E. V. Wilcox, Ph. D.
Horticulture—C. B. Smith.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 1.

	Page.
Editorial notes:	
Increased funds for station maintenance	1
Education of the American farmer	3
Royal Society's catalogue of scientific papers	4
Recent work in agricultural science	5
Notes	97

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

Report of chemical laboratory of Ploti Experiment Station, B. M. Velbel	5
Method for determining small quantities of carbonates, A. D. Hall and E. J. Russell	5
Estimation of alkaline hydrate in presence of monocarbonate, B. North	6
Detection of magnesia in ammonium oxalate precipitates of lime, A. Täubner	6
Determination of cæsium and rubidium as hydrosulphate, etc., P. E. Browning	6
A contribution to the knowledge of metaphosphate, A. Wiesler	6
On calcium carbophosphate, A. Barillé	6
Phospho-molybdenum compounds, F. Mawrow	6
The use of weak solvents in soil analysis, A. D. Hall and F. J. Plymen	6
Report on uniformity in analysis of materials for the Portland cement industry	6
Determination of nitrates in water, S. R. Trotman and H. Peters	6
The determination of nitrogen, E. Durand	7
Contribution to the determination of nitrogen, A. Hebebrand	7
Argand burner for use in Kjeldahl estimation of nitrogen, J. Golding	7
On the Kjeldahl method, C. Neuberg	7
Inorganic ferments, D. McIntosh	7
Provisional methods for analysis of foods, edited by H. W. Wiley and W. D. Bigelow	7
Nitrogen-free extract matter in potatoes, C. H. Jones and B. O. White	7
Nitrogen-free extract matter in artichokes, C. H. Jones and B. O. White	8
Concerning the sugars and organic acids in tropical fruits, A. Borntraeger	8
The constituents of corn pith and elder pith, etc., C. A. Browne, jr	8

Page.

The determination of pentoses and pentosans, E. Kröber and C. Rimbach.... 9
Employment of pentosan determination in testing vegetable materials and paper stock, E. Kröber and C. Rimbach, reported by B. Tollens..... 10
On the alleged reaction of brucin on nitrous acid, G. Lunge..... 10
Behavior of nitric and nitrous acids toward brucin sulphuric acid, L. W. Winkler..... 10
The present status of the chemistry of albumin..... 10
The effect of nascent chlorin upon proteids, R. Ehrenfeld..... 10
The coagulable material in the white of egg, L. Langstein..... 10
The fluorin content of teeth and bones, I, Jodlbauer..... 10
Miscellaneous analyses, C. H. Jones and B. O. White..... 10
New apparatus in water analysis, G. E. Thomas and C. A. Hall..... 10
New extraction apparatus, A. Landsiedl..... 10
A drying oven with circulation of air, W. Gallenkamp..... 10

BOTANY.

The flora of the metamorphic region of Alabama, F. S. Earle..... 10
Changed conditions of Iowa flora incident to settlement of State, L. H. Pammel. 10
Review of the most useful plants of the family Leguminosæ, E. Goeze..... 11
Notes on the northeastern Carices of the section Hyparrhenæ, M. L. Fernald.. 11
The variations of some boreal Carices, M. L. Fernald..... 11
The arrangement of the air canals in the stalks of Nymphæas, M. T. Masters. 11
Behavior of mutilated seedlings, B. D. Halsted..... 11
The embryology and germination of the genus Peperomia, D. S. Johnson.... 11
On kaki-shibu, a fruit juice in technical application in Japan, M. Tsukamoto. 11
On the formation of asparagin in the metabolism of shoots, U. Suzuki..... 12
The amount of soluble albumin in different parts of plants, H. Uno..... 12
On the juice of the pseudotrunk of *Musa basjoo* in winter time, S. Sawa..... 12
The poisonous action of quinone, T. Furuta..... 13
Are caffein and antipyrin in high dilutions poisonous to plants? S. Sawa.... 13
Has urea any poisonous action on phænogams? S. Sawa..... 13
The poisonous action of potassium persulphate on plants, S. Sawa..... 13
The peculiar rôle of magnesia and sulphates in plant growth, R. Dumont..... 14
Influence of different ratios of lime and magnesia on plants, K. Aso..... 14
To what extent should soil be limed? T. Furuta..... 14
The lime content of phanerogamic parasites, K. Aso..... 14
The lime factor for different crops, O. Loew..... 14
Are our native horsetails and ferns poisonous? L. R. Jones..... 14
Germination of Basidiomycetous spores, Margaret E. Ferguson..... 14
Physiology of sea water, R. H. True..... 15
Water as a plant food, W. H. Jordan..... 15

METEOROLOGY—CLIMATOLOGY.

Annual summary of meteorological observations in the United States, 1901.. 15
Monthly Weather Review, Vol. XXX, Nos. 1–3..... 15
Summaries of temperature, rainfall, and sunshine, E. F. Ladd..... 16
Meteorology of 1901, Scotland, A. Buchan..... 16
Meteorological observations in Tunis, 1901–2, G. Ginestous..... 16
Report on meteorological observations made at Chiswick in 1901, E. Mawley. 16
A study of the climate of Tunis, G. Ginestous..... 16
The Third International Hail Protection Congress, Lyons, 1901, J. Vandervaeren..... 16
The mechanism and causation of hot waves, H. M. Watts..... 17

SOILS.

Sixth annual report of the Agricultural Experiment Station of Ploti, 1900.... 17
The development of a soil survey, F. K. Cameron..... 18
The soil as an economic and social factor, F. K. Cameron..... 18
The investigation of cultivated soils, O. Vibrans..... 18
Agricultural soil studies, H. Dubbers..... 18
Studies on cultivated soil, T. Schloesing..... 18
Soils of North Dakota, E. F. Ladd..... 18
Soil moisture study, A. M. Ten Eyck..... 18

Page.
Report on the clays of Maryland, H. Ries 19
On the plasticity of clay, P. Rohland 19
Mineral in Jamaica soils, E. Leuscher 19
The Jurassic region of Belgium, A. Henry 19
The effect of lime on the insoluble phosphates of the soil, W. F. Sutherst 19
The minimum content of lime in soils which respond to liming, Lilienthal 19
The calcium carbonate content of soils, M. Passon 19
Irish soils, including the peat, G. H. Kinahan 19
Causes of sterility in peat soils, J. Dumont 19
Soil temperatures at Flahult Moor Experiment Station, H. von Feilitzen 20
The composition of soil samples from moor lands, O. von Czadek 20
Results of vegetation experiments on marsh soils, B. Tacke 20
Soil tests and variety tests, E. W. Hilgard 20
Nitrification in different soils, W. A. Withers and G. S. Fraps 20
Nitrogen of humus, A. Dojarenko 20
Humus and soil fertility, H. Snyder 21
The chemical rôle of earthworms, H. d'Anchald 21
The Campbell method of soil culture, H. M. Cottrell 21
Interior land changes 21

FERTILIZERS.

Organic nitrogen availability of fertilizers, C. H. Jones and B. O. White 21
Roots of plants as affected by manuring, C. von Seelhorst 21
Manure from steers and swine, W. A. Henry 21
Bacteriological investigations relating to nitrogen of manure, H. G. Söderbaum. 22
The utilization of night soil as manure, R. S. Joshi 22
On minerals occurring in Australian bat guano, R. W. E. MacIvor 22
Green manuring on sugar estates 22
The plowing under of green manures for winter plantings, Causemann 22
Forty per cent potash salt *v.* kainit, M. Maercker and W. Schneidewind 22
Field experiments with ammonium sulphate in the province of Posen, Kloepfer. 22
Fertilizer experiments on moor soils, H. von Feilitzen 22
Phosphatic fertilizers for moor soils, K. C. Lassen 22
Better utilization of nitrogen supply of soil and air as a result of liberal applications of phosphoric acid, F. Giersberg 22
The natural phosphates and their use in agriculture, Maizières 23
Slags and superphosphates—results of 10 years' experiments, E. C. Pradel 23
The agricultural value of Martin slag, A. Petermann 23
Discovery of mineral phosphates in South Australia 23
Note on free acid in superphosphate, J. Ostersetzer 23
Buying and using commercial fertilizers, L. A. Clinton 23
The purchase of artificial manures 24
Fertilizers. I, Sources and composition, B. H. Hite 24
Commercial fertilizers, H. A. Huston and W. J. Jones 24
Analyses of commercial fertilizers and Paris green, W. C. Stubbs 24
Analyses of commercial fertilizers, J. L. Hills, C. H. Jones, and B. O. White. 24
Commercial fertilizers, J. H. Stewart and B. H. Hite 24
The new West Virginia fertilizer law, J. H. Stewart 24
Regulations concerning sale of fertilizers, etc., in Finland, G. Grotenfelt 24
Artificial manures in Russia 24
Boiler scale, E. F. Ladd 24

FIELD CROPS.

Report on field crops, J. H. Shepperd and A. M. Ten Eyck 24
Report of the botanist, H. L. Bolley 25
Experiments with field crops, R. S. Shaw 26
The Woburn field experiments, 1899 and 1900, J. A. Voelcker 27
The Woburn pot-culture experiments in 1900, J. A. Voelcker 28
The Essex field experiments, 1896–1901. I, Permanent pastures, T. S. Dymond. 28
Field experiments at Ploti Agricultural Experiment Station, A. G. Karabetov. 29
Arid farming or farming without irrigation, J. A. Widtsoe and L. A. Merrill. 29
Lucern, B. Dyer 29
Lucern growing as fodder for stock, E and O. Evans 30
Overdressing of barley, H. Baird 30

Page.

Planting beets in hills, M. Ringelmann 30
The breeding of cereals by means of artificial crossing, E. Tschermak 30
Stooling of cereals in its relation to their improvement, Rimpau 30
The influence of the color of clover seed on the progeny, C. Fruwirth 30
Clover on soils poor in lime, P. P. Dehérain and E. Demoussy 30
Corn culture, J. H. Shepperd and A. M. Ten Eyck 30
Analyses of corn with reference to its improvement, J. T. Willard et al 31
Cultivation of maize at the Cawnpore Experiment Station, P. V. Subbiah 32
Cultivation of longer-stapled cottons at Cawnpore Station, P. V. Subbiah 32
Experience with cowpeas 32
Modern flax culture in western France, H. Blin 32
Drought-resistant forage crops at Highmore, S. Dak 32
Grass experiments, H. J. Wheeler and G. E. Adams 32
Brome grass and timothy compared, E. F. Ladd 33
Fowl meadow grass, L. R. Jones and A. W. Edson 33
The hop and its English varieties, J. Percival 33
Manuring mangels 34
Test of various kinds of oats and their composition, J. Speir and A. P. Aitken 34
The culture of oats, L. Grandeau 34
Spring seeding of oats and barley, L. Grandeau 34
Boxing seed potatoes, J. Speir 34
Fertilizer experiments with potatoes, S. Hammar 34
Rice growing in British Guiana 34
Sugar beets in Montana in 1901, F. W. Traphagen 34
Sugar-beet experiments in Nebraska, T. L. Lyon and A. T. Wiancko 34
Sugar-beet investigations in 1901, J. W. Ames 35
Variety tests of sugar beets, J. J. Vañha 35
Large and small seed balls in sugar-beet culture, B. Procházka 35
Breeding sugar beets, von Rümker 36
The growth of the sugar beet, O. Vibrans 36
Superphosphate and nitrate of soda as fertilizer for sugar beets, F. Lubanski 36
Experiments with seedling and other canes at Barbados in 1901, J. P. d'Albuquerque and J. R. Bovell 36
Culture experiments with seed-cane varieties, J. D. Kobus and J. A. van Haastert 36
Composition of sugar cane, G. d'Utra 36
Sugar-cane diseases in Gódávari and Ganjám districts, C. A. Barber et al 36
The cultivation of the teasel, L. A. Clinton 36
Effects of soluble and insoluble phosphate on the turnip crop, J. Milne 36
The adaptation and improvement of winter wheat, T. L. Lyon 36
Ash analysis of wheat, E. F. Ladd 37
Hybridization of wheat, A. Vilcoq 37
Hybrid wheat de Massy, A. Dubois 37
Thick *v.* thin sowing of wheat and rye, L. Grandeau 37
Universal nomenclature of wheat, N. A. Cobb 37
Silos for grain, M. Ringelmann 37

HORTICULTURE.

Employment of chemical fertilizers in market gardening, E. Hegh 37
Fertilizers for garden crops 38
The evolution of vegetable culture, W. W. Rawson 38
Soils and fertilizers for greenhouse crops, H. J. Patterson and T. H. White 38
Vegetable raising in greenhouses in the Klin district, Government Tver 39
Forcing lettuce, C. P. Close 39
Growing watermelons in the North; classification of watermelons, F. W. Rane 39
Muskmelons, J. Craig 40
American onions, A. R. Gross 40
Cooking quality of peas and beans as affected by fertilizers, K. de Vrieze 40
Early tomatoes in the open ground 41
Experiments with tomatoes, B. D. Halsted 41
Ginger 41
Raising plants from cuttings, J. W. Coley 41
The influence of stock upon scion, J. Burvenich 41
Selection of scions, P. Durand-Dassier 41
Horticultural department, C. Wilson 41

Page.
Report of the fruit experiment stations in Ontario, L. Woolverton et al 42
Questions of hygiene in the fruit garden, B. Nalimov 42
On the manuring of orchard fruit trees, L. Grandeau 42
Orchard management, cover crops, etc., S. T. Maynard and G. A. Drew 42
Orchard notes, W. M. Munson 42
Cross fertilizing of apples, W. Saunders 43
Why apple trees fail, E. Walker 43
An inventory of apples grown in Grand Isle County, Vt., F. A. Waugh 43
Propagation of plums—second report, F. A. Waugh 43
Hybrid plums—third report, F. A. Waugh 44
Peaches and nectarines 45
Fruit culture in Egypt, G. Bonaparte 45
Orange culture, picking and packing, Johnston 45
Bananas under irrigation, H. J. Charles 45
The cultivation of pineapples and other products of Florida, R. Thomson 45
Seasons for planting pineapples 45
Pine cultivation in Jamaica, H. H. Cousins 45
The date-palm tree, G. Bonaparte 45
The "arctic" berry fraud, J. W. Blankinship 45
New classifications of fruits, G. Bellair 45
Report of committee on new fruits, H. L. Hutt, W. T. Macoun, and L. Woolverton 46
Old world contributions to Western orchards, C. E. Bessey 46
Spring frosts and fruit trees, H. Müller-Thurgau 46
Fruit shipments to Britain, J. W. Robertson 46
Coffee culture, A. Hempel 46
Cacao culture and preparation, H. J. Wigman 46
The culture of rubber plants in Java, Yersin 46
Notes on rubber strip for grafting, R. B. Rogers 46
The caoutchouc tapper, H. C. Praasterink 47
New method of propagating gutta-percha trees 47
Possibilities of strawberry culture in the State, J. W. Blankinship 47
Culture of strawberries in the district of St. Geniez, E. Marre 47
Salicylic acid in strawberries, L. Portes and A. Desmoulières 47
Notes on ringing and other like practices with table grapes, F. Charmeaux 47
Fruit forcing under glass, W. Turner 47
Vine culture as exemplified at the Paris Exposition, J. Blyth 48
Experiments with commercial fertilizers on vines, E. Zacharewicz 48
Grafting of vines, A. Ville 48
The propagation and cultivation of the vine in South Africa, J. P. de Waal 48
A native hedge plant, J. W. Blankinship 48
Some talk about wild gardens, H. S. Leonard 48
Production of double flowers, Douglas 48
Carnation and dahlia scales, L. Barron 48
Ringing chrysanthemums, U. P. Hedrick 48
The origin and development of the cactus dahlia, C. G. Wyatt 49
A new race of hybrid alpine irises, W. J. Caparne 49
On the cultivation of Oncocyclus irises, H. Ewbank 49
On some experiments in the cultivation of Oncocyclus irises, J. Hoog 49
Forcing lilac flowers, F. van Driessche 49
Official report of the Conference on Lilies 49
Rose Balduin, or Helen Gould 50
Perfume plants 50

FORESTRY.

Forest work in the States 50
Forests, Arbor Days, and manuring forest trees, F. E. H. W. Krichauff 50
Teaching forestry at Berea College, S. C. Mason 50
The disabilities attaching to the planting of woods, G. Cadell 50
Forest trees for calcareous soils, P. Mouillefert 50
Exotic conifers, their timber and value as an investment, D. F. Mackenzie 50
English coppices and copsewoods, J. Nisbet 51
The forests of Prussia, G. H. Murphy 51
The State forest nursery at Gosford 51
Algerian cork forests 51

Page.

The palm trees of Brazil, J. C. Branner 51
The Douglas spruce as a park tree, E. André 51
On some minor resources in connection with forestry, A. K. Myhrvold 51
Frost checks and wind shakes, E. S. Bruce 51
The use of anatomical characters in the identification of wood, H. Stone 52
Table of the U. S. Government forest reserves, arranged by States 52

SEEDS—WEEDS.

Study on germination and growth of Leguminosæ, F. G. Miller and L. H. Pammel 52
Some observations concerning the viability of red clover seed, S. Hammar 52
Weeds in general; two newcomers into Pennsylvania, W. A. Buckhout 52
Two weedy plants new to America, L. R. Jones and A. W. Edson 52
The bird vetch or wild pea, L. R. Jones and A. W. Edson 53
The Canada thistle (*Circium arvense*), Samsö-Lund and E. Rostrup 53
Killing weeds with chemicals, L. R. Jones and A. W. Edson 53
Public measures for eradication of weeds and other injurious plants, E. Korsmo 54
The eradication of prickly pear, G. Valder 54

DISEASES OF PLANTS.

Crop, orchard, and garden pests, T. W. Kirk 54
A preliminary note on the cause of flax-sick soil, H. L. Bolley 55
Flax wilt and flax-sick soil, H. L. Bolley 55
Potato diseases and their remedies, L. R. Jones and A. W. Edson 55
Diseases of sugar cane in Bengal, A. T. Gage 56
The dying of the cane in the fertilizer test garden, J. D. Kobus 56
Beet-root tumor, M. C. Cooke 57
Disease in turnips and swedes, R. S. MacDougall 57
The destruction of cell walls by bacteria, E. F. Smith 57
Formalin treatment for grain smuts, R. S. Shaw 57
Concerning the parasitism of Botryosporium, V. Peglion 57
Disease of ginger in Jamaica 57
The asparagus rust, V. H. Davis 58
Cucumber leaf disease, M. C. Cooke 58
The prevention of onion smut, A. D. Selby 58
A peculiar rotting of Greening apples in 1900, L. R. Jones and A. W. Edson 58
Peach-leaf curl and its treatment, G. Quinn 58
A Monilia-like disease of sour cherries, Aderhold 58
A disease of plums and cherries, M. C. Cooke 59
Cherry diseases, W. Carruthers 59
Silver leaf, M. C. Cooke 59
Silver leaf 59
A disease of the black locust, H. von Schrenk 59
The Botrytis disease of coniferous seedlings, J. Tuzson 59
A disease of the betel-nut palms, G. Watt 60
Cacao canker in Ceylon, J. B. Carruthers 60
Some spraying experiments for 1901, L. F. Henderson 60
Spraying for grape rot, A. D. Selby and J. F. Hicks 60
The relation of grape spraying to public health, A. D. Selby 61
The meteorological conditions requisite for injurious fungi, K. Sajo 61
Experiments with the fungicide sulfurin, K. Mohr 61
The meteorological conditions for the development of mildews, K. Sajo 61
Lily fungi, M. C. Cooke 62
Iris-leaf blotch, M. C. Cooke 62
A snowdrop disease, G. Massee 62
Review of literature relating to plant protection during 1900, M. Hollrung 62

ENTOMOLOGY.

Miscellaneous notes on injurious insects, II, V. H. Lowe 62
First report of the State entomologist, W. E. Britton 63
Report of the entomologist, R. A. Cooley 63
Report on injurious insects and plant diseases in 1901, W. M. Schöyen 64
Insect attacks in 1901, R. S. MacDougall 64

Page.
Insect pests attacking truck crops, F. W. Mally 64
The onion thrips, F. M. Webster 64
An eight years' study of chinch bug outbreaks in Ohio, F. M. Webster 64
The plant lice of sugar cane in Java, L. Zehntner 65
Insect enemies to fruit, and their remedies, W. B. Smith 65
Insects injurious to fruit, A. H. Snyder 65
Rhynchites minutus an enemy of the strawberry, J. Ritzema Bos 65
Combating root louse of gooseberry and currant, J. Ritzema Bos 65
Report of the State entomologist, J. B. Smith 65
Report on inspection of Roanoke County, Va., for San José scale, W. B. Alwood. 65
Three common orchard scales, H. T. Fernald 65
Treatment for San José scale, J. H. Stewart 65
The oak scale insect, J. Ritzema Bos 66
The oak flea-beetle (*Haltica erucæ*), J. Ritzema Bos 66
Insect enemies of the pine in the Black Hills Forest Reserve, A. D. Hopkins. 66
Some insect enemies of living trees, A. D. Hopkins 66
The shade-tree insect problem, A. H. Kirkland 66
Killing the eggs of the gypsy moth by means of kerosene, J. Ritzema Bos 67
Report of committee on gypsy moth, insects, and birds, A. Pratt et al 67
A new nomenclature for the broods of the periodical cicada, C. L. Marlatt ... 67
General review of animal and vegetable parasites of cocoanut, A. Zimmermann. 67
The small rose-leaf wasp (*Blennocampa pusilla*), J. Ritzema Bos 67
Certain Javanese Ascomycetes which are parasitic on Coccidæ, A. Zimmermann. 67
South African locust fungus 67
Concerning certain mosquitoes, J. B. Smith 67
The mosquito pest and how it may be abated, J. B. Smith 68

FOODS—NUTRITION.

Foods and food adulterants, W. D. Bigelow et al 68
Chemical analysis of a flour made from India corn, S. Grimaldi 69
Flour from Arnautka wheat, E. F. Ladd 69
The food value of starch, flour, and grits, P. Carles 69
Substitutes for bread used in times of famine, F. Erismann 69
The amount of bread obtained from flour, Ballard 69
Adulteration of wheat flour, M. Lozano y Castro 69
A plant butter used as a substitute for cocoa butter, G. Possetto 69
Gluten alimentary pastes, G. Teyxeira 69
Fersan—its therapeutic and nutritive properties, H. F. Tourlet 69
Plasmon, E. F. Ladd 69
Infant foods, E. F. Ladd 69
Food products of Canada and names of some exporters 69
Preparing and preserving meat for metabolism experiments, W. J. Gies 69
Concerning dietary studies of the people of the United States, P. O. Smolenski. 69
Dietary computer, Ellen H. Richards 70
Therapeutic value of vegetable diet, L. Kuttner 70
The valuation of a vegetarian diet, Albu 70
Metabolism on a vegetarian diet, Albu 70
Precautions to be taken by consumers of vegetables, Ceserole 70
The energy value of the diet of man, M. Rubner 70
Meat and meat preparation in the diet of man, H. Poda and W. Prausnitz 71
The power of alcohol to protect protein, R. O. Neumann 71
Cleavage of protein in man when severe work is performed, C. Jackson 71
Concerning the tryptic cleavage of protein, K. Mochizuki 71
The influence of environment upon the properties of protein, J. Starke 71

ANIMAL PRODUCTION.

Commercial feeding stuffs in the Connecticut market 71
Analyses of commercial feeding stuffs, J. L. Hills 72
Indian food grains and fodders—their chemical composition, J. W. Leather ... 72
The composition of tendon mucoid, W. D. Cutter and W. J. Gies 72
Chemical constituents of tendinous tissue, L. Buerger and W. J. Gies 72
Composition of yellow fibrous connective tissue, G. W. Vandegrift and W. J. Gies 72
The nutritive value of gelatin, O. Krummacher 72

Page

Effect of variations in method for artificial digestion of proteids, G. Berju..... 7
Some observations on the metabolism of protein, M. Gruber..... 7
Heat of combustion and nutritive value of foods, J. Frentzel and M. Schreuer. 7
Contribution to question of protein minimum, M. Cremer and M. Henderson.. 7
Cause of increased proteid metabolism during fasting, F. N. Schulz..... 7
The influence of body fat in fasting animals, E. Voit..... 7
Cause of increased cleavage of protein during fasting, E. Voit..... 7
The formation of fat from carbohydrates, K. B. Lehmann and E. Voit..... 7
The utilization of rhamnose by the animal body, etc., M. Cremer..... 7
Occurrence of oxy-phenyl-ethyl-amin in pancreas digestion, etc., R. L. Emerson 7
Studies on the motor activity of the stomach, II, Moritz..... 7
The breeders' associations of the German Empire, O. Knispel..... 7
Influence of prize awards on Swedish animal industry, J. Ekelund..... 7
Animal husbandry in Russia, R. Müller..... 7
Stock feeding, C. M. Conner..... 7
Utilization of waste products of Western farms by means of live stock, R. S. Shaw 7
Beef production in Iowa, W. A. McHenry..... 7
Cod-liver oil as a substitute for cream in calf rearing, R. S. Seton..... 7
Some notes on sheep husbandry, H. W. Mumford..... 7
The goat in Germany, F. Dettweiler..... 7
Pig-feeding experiments, J. R. Campbell..... 7
Investigations on metabolism of pigs fed sugar, etc., E. Meissl and W. Bersch.. 7
Experimental contributions to the theory of heredity, J. C. Ewart..... 7
Poultry experiments, J. H. Shepperd..... 7
Subdepartment of poultry, H. C. Gardner..... 7
Incubators and brooders and their management, D. S. Thompson..... 7
Determination of the soundness of eggs by their specific gravity, C. Coggi.... 7

DAIRY FARMING—DAIRYING.

Immediate effect on milk production of changes in the ration, W. P. Wheeler. 7
Feeding trials with cows, J. L. Hills..... 7
A comparison of feeding trial methods, J. L. Hills..... 7
The effect of feed on the quality of butter, J. L. Hills..... 7
Feeding experiments with gluten meal and feed for dairy cows, H. Goldschmidt..... 7
On feeding of dairy cattle, L. Dyhre..... 8
Feeding corn stover; dehorning milch cows, C. M. Conner..... 8
Jersey cattle in Jutland, J. Larsen..... 8
The variation in the composition of cows' milk, H. Ingle..... 8
Variations in cream and milk tests, A. H. Wheaton..... 8
Killing tubercle bacilli in milk heated to a temperature of 60° C., W. Hesse.. 8
On the composition of Dutch butter, J. J. L. van Rijn..... 8
Characteristics of fat of Norwegian creamery butter, F. H. Werenskiold et al. 8
Report of Danish butter exhibits during 1901, F. Friis..... 8
Denmark's butter exports, 1900–1901, B. Böggild..... 8
Testing Babcock milk and cream bottles, C. H. Jones..... 8

VETERINARY SCIENCE AND PRACTICE.

Therapeutic observations..... 8
The culture of anaerobic bacteria, H. Hammerl..... 8
The dissemination of infectious diseases by insects, C. F. Dawson..... 8
Parasitically inoculated diseases, E. G. Wheler..... 8
Verminous bronchitis in calves..... 8
The migration of the embryos of tapeworms, Hofmann..... 8
The toxin of tapeworms, Massineo and Calamida..... 8
Sturdy or gid, F. V. Theobald..... 8
Treatment of sheep scab with acaprin, H. Raebiger..... 8
Prophylaxis of dourine, T. Buffard and G. Schneider..... 8
An attempt at a classification of endoglobular hematozoa, Laveran..... 8
Mange in cattle and horses and lice on hogs, A. T. Peters..... 8
The position of Dr. Koch on the subject of human tuberculosis, S. Arloing... 8
Report of the tuberculosis commission, C. H. Cook..... 8
Serum diagnosis in tuberculosis, G. Carrière..... 8
Sensibilizing substances in serum of tuberculous patients, J. Camus and P. Pagniez..... 8

Page.
Tuberculin as a diagnostic of tuberculosis in cattle, J. Smith 87
The tubercle bacillus in feces, D. Anglade 87
Lecithin in tuberculosis, H. Claude and A. Zaky 87
Action of urea on cultures of tubercle bacillus in bouillon, etc., Rappin 88
Combating bovine tuberculosis, H. Raquet 88
Experimetal plastic spinal meningitis, Armand-Delille 88
Anthrax, D. Pugh 88
Recent work on blackleg, T. Kitt 88
Labial actinomycosis in cattle, Z. F. Eleneveski 88
Cattle plague and inoculation against it in South Africa, A. Theiler 89
Treatment of malignant catarrhal fever of cattle with colloidal silver, Traeger 89
Iodid of potash as treatment for parturient paralysis, A. Kragerud 89
Report of the commission for combating foot-and-mouth disease 89
Intercantonal enforcement of regulations against foot-and-mouth disease, J. Ehrhardt 90
A new cure for foot-and-mouth disease, A. H. Dellschaft 90
On braxy, D. J. Hamilton 90
Acinous tumors of the gall bladder in cattle, Zellhuber 90
Investigations on the cutis of the hoofs of cattle, H. Hohmann 91
Serum agglutination as a means for diagnosing glanders, C. O. Jensen 91
Diagnosis of glanders, N. K. Gadzyatzkii 91
Acute epizoötic leucoencephalitis in horses, W. G. MacCallum and S. S. Buckley 91
Pneumonia and vaccination, Reinländer 92
Equine malaria, A. Theiler 92
The appearance of colic in consequence of rusty barley straw, Mierswa 92
The pathogenesis of roaring in horses, Thomassen 92
Disinfection of stables with steam, Kramell 92
Observations on the chicken plague, L. Greve 93
Brief statistics, M. Strebel 93
Report of the New Jersey State Board of Health, H. Mitchell 93

AGRICULTURAL ENGINEERING.

Irrigation department, S. Fortier 93
Report on irrigation in South Africa, W. Willcocks 93
Recent developments in Punjab irrigation, S. Preston 94
Farmers' weirs, S. Fortier 94
Agricultural machines at the Paris Exposition, 1900, Albert and Schiller 94
Second report on the highways of Maryland, H. F. Reid and A. N. Johnson 94
Horse and cattle barns built in 1901, E. G. Schollander 94
Hay and sheaf sheds, R. Henderson 94
Compacting effect of plow teams upon the furrow, J. H. Shepperd 94
Cooling refrigerator cars by means of ice or ammonia, V. Storch, H. P. Lundé 94

MISCELLANEOUS.

Eighth Annual Report of Montana Station, 1901 95
Report of Director of New York State Station for 1901, W. H. Jordan 95
Organization lists of the agricultural colleges and experiment stations 95
Experiment station work—XX 96
The card index of experiment station literature 96
The station bulletin, J. B. Weems 96
The farmer and his education, W. J. Beal 96
Subdivision of agriculture for purposes of instruction and research, E. Davenport 96
Agricultural imports and exports, 1897–1901, F. H. Hitchcock 96
Cotton in Egypt 96
Sugar industry of Saxony, B. H. Warner, jr 96
Clearing new land, F. Williams 96

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The Editor and H. W. Lawson.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. Beal.
Botany and Diseases of Plants—Walter H. Evans, Ph. D.
Foods and Animal Production—C. F. Langworthy, Ph. D.
Field Crops—J. I. Schulte.
Entomology and Veterinary Science—E. V. Wilcox, Ph. D.
Horticulture—C. B. Smith.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 2.

Page.

Editorial notes:
- Fiftieth anniversary of the first State experiment station ... 101
- Prof. A. Petermann, founder of experiment station system of Belgium ... 103
- Jacob Richards Dodge, agricultural statistician ... 104
- Virchow's service to agriculture ... 105

Convention of Association of Official Agricultural Chemists, 1902, H. W. Lawson ... 107
Recent work in agricultural science ... 117
Notes ... 197

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

The determination of perchlorate in saltpeter, A. Dupré ... 117
The determination of total phosphoric acid in Thomas slag, C. Aschman ... 117
Note on the analysis of superphosphates, J. Legrand ... 117
Determination of sulphuric acid in soils, C. B. Williams ... 117
A lime test for soils rich in lime and marls, M. Passon ... 117
The determination of ammonia in waters, O. Emmerling ... 117
The solubility of dicalcium phosphate in pure water, A. Rindell ... 118
Comparative nitrogen determinations, O. Kellner ... 118
Criticism of official method for estimation of nitrogen, C. A. Mooers ... 118
Experiments with the Kjeldahl method of nitrogen estimation, H. D. Law ... 118
Source of error from use of mercury in Kjeldahl method, C. A. Mooers ... 118
Application of Kjeldahl method in the tanyard, J. G. Parker ... 118
An easily made and safe dephlegmator for Kjeldahl distillations, W. J. Lovett ... 119
Fixing nitrogen from the air, T. C. Martin ... 119
Report on general work in the chemical laboratory, C. A. Goessmann ... 119
Potash and phosphoric acid content of potato leaves, J. Seisl and E. Gross ... 119
Compilation of analyses of fruits, garden crops, etc., H. D. Haskins ... 119
Laboratory apparatus, P. N. Raikow ... 119
Apparatus for examination of atmosphere, W. Chattaway and F. M. Wharton ... 119

BOTANY.

Page.
Influence of the elementary plant foods on plant growth, A. N. Pearson 119
Investigations on the nutrition of plants by amids, L. Lutz 119
The electrical conductivity of plant juices, F. De F. Heald 120
The sensory area of the roots of land plants, F. C. Newcombe 120
The significance of transpiration, C. R. Barnes 120
The influence of metallic poisons on respiration, E. B. Copeland 121
Cyanogenesis in plants, W. R. Dunstan and T. A. Henry 121
Germination of spores of Basidiomycetous fungi, Margaret C. Ferguson 121
Cell nuclei in some cases of parasitism or intercellular symbiosis, R. Chodat .. 121
Root tubercles of bur clover and some other leguminous plants, G. J. Peirce .. 122
On the development of root tubercles of leguminous plants, E. Laurent 122

METEOROLOGY—CLIMATOLOGY.

Eclipse meteorology and allied problems, F. H. Bigelow 123
Meteorological observations, J. E. Ostrander, H. L. Bodfish, and S. C. Bacon. 123
Report of department of meteorology and meteorological summary, C. H. Pettee. 123
Meteorological observations, W. T. Ellis, R. Robertson, S. A. Bedford, et al 124
Meteorological chart of the Great Lakes, A. J. Henry and N. B. Conger 124
Wind velocity and fluctuations of water levels on Lake Erie, A. J. Henry 124
A year of weather and trade in the United States, R. DeC. Ward 124
Composition of Barbados rainfall 124
Rainfall at Variety Experiment Stations, Barbados, Dec., 1899, to May, 1901 . 124
A study on the climate of Tunis, G. Ginestous 124
Ten years' observations on influence of weather on sugar beets 124
The gases of the atmosphere, H. F. Keller 124

WATER—SOILS.

The significance of phosphates in natural waters, A. G. Woodman 125
Artesian waters and irrigation, W. G. Cox 125
Well waters from farm homesteads, F. T. Shutt 125
Some excessively saline Indian well waters, J. W. Leather 125
The examination of water from some typhoid-polluted wells, S. Rideal 125
The temperature of the soil, D. T. MacDougal 125
Capillary studies and filtration of clay, L. J. Briggs and M. H. Lapham 126
Study of solution of phosphoric acid in soil solutions, G. Paturel 127
Method of determining heat generated when soils are moistened, A. Mitscherlich . 127
Soil survey in Salt River Valley, T. H. Means 127
Soil investigations, F. T. Shutt 127
The sampling of soils, J. W. Leather 127
Soil cultivation, J. H. Grisdale 128
Summer fallows, A. Mackay 128

FERTILIZERS.

The cowpea and the velvet bean as fertilizers, J. F. Duggar 128
Fertilizer experiments on moor soils, 1887–1899, H. von Feilitzen 128
Pot experiments on action of burnt lime and marl, R. Ulbricht 129
Dependence of yield on relation between lime and magnesia in soils, O. Loew . 129
On the fertilizing value of peat ashes, J. Boes 129
Nitrate of soda, potassium perchlorate, and crops, L. Grandeau 129
A new use for potash salts in agriculture, F. Lucke 129
Influence of soil moisture on the action of phosphoric acid, C. von Seelhorst .. 129
The comparative value of different phosphates, D. Prianishnikov 129
Phosphate discovery in New Zealand 130
Bureau of fertilizers, R. E. Rose et al 130
Report on official inspection of commercial fertilizers, etc., C. A. Goessmann . 130
Compilation of analyses of agricultural chemicals, etc., H. D. Haskins 131
Inspection of fertilizers in 1901, F. W. Morse 131
Analysis of commercial fertilizers, South Carolina Station 131
Fertilizers, F. T. Shutt 131

FIELD CROPS.

Field experiments with farm crops, W. Saunders et al 132
Cooperative experiments in agriculture 132

Page.
Report of the agriculturists, W. P. Brooks and H. M. Thomson 133
Stock ranges of northwestern California, J. B. Davy 135
Forage conditions on the northern border of the Great Basin, D. Griffiths..... 136
Experiments in range improvement in central Texas, H. L. Bentley..... 137
Grasses and leguminous crops for the Arkansas Valley, H. H. Griffin..... 139
Grass seeding on irrigated land, W. Jones..... 139
Awnless brome grass, J. Fletcher..... 139
Notes on summer forage crops, J. B. Lindsey..... 139
Improvement of cereals during the last ten years, N. H. Nilsson..... 139
Types of rye and wheat grown under field conditions, M. Fischer..... 140
Alfalfa pasture in Argentina, B. W. Snow..... 140
Breeding pure forms of Bohemian barley, J. Nolč 140
Hungarian and Virginia dent corn varieties, L. Kiessling..... 140
A chemical study of the Sea Island cotton seed, F. S. Shiver 140
Hop culture in Belgium, L. Béthune..... 141
Potatoes grown under straw..... 141
Report on ramie, E. Dazey..... 141
The rice industry of Louisiana and Texas, A. E. Hebert 141
Pennsylvania sugar beets in 1901, W. Frear and W. T. Carter 141
The sugar-beet industry, H. W. Wiley..... 142
The influence of nitrogen, potash, and phosphoric acid on the sugar beet..... 142
Growing Sumatra tobacco under shade in the Connecticut Valley, M. Whitney. 142
Tobacco culture in Haiti..... 142
The wheat industry in the Philippines..... 142
Variety tests with winter wheat, A. Sempolovski..... 142

HORTICULTURE.

Report of the South Haven Substation, Michigan, for 1901, S. H. Fulton..... 143
Notes on vegetables, L. R. Taft and M. L. Dean..... 143
Fruits, vegetables, flowers, and ornamental shrubs, W. T. Macoun et al 144
Celery tests on American Gardening trial grounds 144
Growing melons at Rockyford, Colo., D. V. Burrell..... 144
Onion beginnings; seeding, packing, and shipping, H. L. Wells 144
Forcing rhubarb in the field 144
Fertilizer tests on tomatoes, H. A. Huston..... 145
Successful culture of tomatoes for canning, E. J. Dirickson 145
Mushroom culture in France, J. K. Gowdy 145
Culture of edible mushroom *Tricholoma nudum*, J. Costantin and L. Matruchot. 145
Experiments in grafting, H. Lindemuth 146
Influence of stock on scion, L. H. Pammel..... 146
Influence of the hardness of wood in grafting cider apples, E. Leroux..... 146
The home fruit garden: Preparation and care, L. C. Corbett..... 147
Canning of fruits and vegetables, G. C. Butz..... 147
The orange in southern California, J. W. Jeffrey..... 147
Orange conference..... 147
Report on cooperative experiments with small fruits, H. L. Hutt 147
Strawberry notes for 1901, R. L. Taft and M. L. Dean..... 147
A preliminary note on the enzym in tea, M. K. Bamber and H. Wright..... 147
Cultivation of pepper in the Bombay Presidency, J. Mollison..... 147
Congress for the hybridization of the grape, L. J. Grandvoinnet..... 147
Table of comparative merits of grapes, T. S. Hubbard..... 148
Bench grafting resistant vines, B. Bruck..... 148
Direct producers, Ravez, Bonnet, Buffard, Dupont, and Rey 148
Tests of commercial fertilizers on vines, E. Chuard and C. Dusserre..... 148
Phosphoric acid and wines, G. Paturel..... 148
Manuring vines, E. H. Rainford..... 149
Grafting and budding walnuts..... 149
Etherizing lilacs for early forcing, F. Harms..... 149
The effect of ether in forcing plants..... 149
Ether forcing of plants, A. Maumene 149
Watering with hot water..... 149
Methods and results of sterilizing, G. E. Stone..... 150
A new spring flowering iris 150
Growing water lilies from seed, G. B. Moulder 150
The hybridization of orchids and their culture from seed, A. Hefka..... 150
Winter protection for tea roses 150
Fertilizers for sweet peas..... 150

FORESTRY.

Page.
A working plan for forest lands near Pine Bluff, Ark., F. E. Olmsted 150
Massachusetts forestry, W. R. Sessions 151
Report of the superintendent of forestry for Canada, E. Stewart 151
Report of director of forestry for Province of Ontario, T. Southworth 151
Management of the farmer's wood lot, W. N. Hutt 151
Experiments in tree planting on Sable Island, W. Saunders 152
Forest belts, W. T. Macoun 152
Notes on the arboretum, S. A. Bedford 152
Trees and shrubs, A. Mackay 152
The hardy catalpa, H. F. Roberts 153
Catalpa plantations at Kansas Agricultural College, A. Dickens, G. O. Greene. 153
The western red cedar, W. M. Bomberger 153
A forestry plantation after thirty years, E. Reeves 154
Shelter planting, W. M. Bomberger 154
Forest trees for park purposes, J. T. D. Fulmer 154
The decay of timber and methods of preventing it, H. von Schrenk 154

SEEDS—WEEDS.

The intramolecular respiration of seeds, E. Godlewski and J. Polzeniusz 154
Tests of the vitality of seed grain and other seeds for 1901, W. Saunders 155
How long may beet seed be stored? F. Lubanski 155
Report of the Skara Chemical and Seed-Control Station, 1901, S. Hammar 155
Weed seed as an indicator of the origin of clover and grass seed, O. Burchard. 156
Noxious weeds, T. N. Willing 156
New method for combating wild radish and mustard, Heinrich 156

DISEASES OF PLANTS.

Plant diseases of 1901, W. Paddock 156
Report of the botanists, G. E. Stone and R. E. Smith 157
Notes on fungus diseases, H. H. Lamson 158
Studies in smut diseases of cereals and their prevention, C. von Tubeuf 159
New species of Uredineæ, J. C. Arthur 159
A new disease of alfalfa, G. Pollacci 159
Clover anthracnose, B. Mehner 159
Potato failures, F. M. Rolfs 159
Study of a new bacterial disease of the potato, G. Delacroix 160
Asparagus rust, W. T. Macoun 160
Cantaloupe blight in 1901, H. H. Griffin 160
Nematodes as enemies of garden plants, A. Osterwalder 160
Canker of apple trees, H. Hasselbring 160
Notes on spraying for bitter rot, J. T. Stinson 161
Brown rot of peaches and plums, C. C. Newman 161
A new disease of orange, T. Ferraris 161
Coffee diseases in Brazil, F. Noack 161
On the use of potassium permanganate against oidium, B. Chauzit 162
A new factor in combating mildews, F. W. Neger 162
Life history and means for detection of timber rot fungi, etc., G. Marpmann .. 162
A fungus disease of juniper, A. von Jaczewski 162
Studies on *Æcidium elatinum*, E. Fischer 162
The poplar rust, J. Fletcher 162
Maple seed blight, J. Fletcher 162
The action of copper on leaves, S. M. Bain 163
Some recent work with fungicides by the Ohio Experiment Station, A. D. Selby. 163
The solubility of a mixture of copper and sodium sulphates, Massol and Maldes. 164

ENTOMOLOGY.

Some insects injurious to vegetable crops, F. H. Chittenden 164
Proceedings of the Entomological Society of Washington 165
Thirty-second annual report of the Entomological Society of Ontario, 1901 ... 165
Report of the entomologist, J. Fletcher 166
Entomological notes, J. A. Ortiz 167
Injurious insects, J. C. Chapais 167
Some insects which are injurious in springtime, H. Faes 167

Page.
Notes on entomology, A. Lehmann 169
Modern methods of studying and controlling horticultural insects, J. B. Smith. 169
Insects and insecticides, C. P. Gillette 169
The more important insects injurious to wheat in Missouri, J. M. Stedman ... 169
Orchard enemies in the Pacific Northwest, C. V. Piper 169
Principal insects liable to be distributed on nursery stock, N. Banks 169
Treatment for San José scale in orchard and nursery, J. B. Smith 169
Lime mixtures for eradication of oyster-shell bark-louse, W. T. Macoun 170
Treatment for the oyster-shell bark-louse, W. S. Blair 170
Arsenical sprays for the codling moth 170
Chemistry of insecticides and fungicides, F. T. Shutt 170
A new emulsion for spraying, J. D. Ormsby 170
Carbolic emulsion, J. D. Ormsby 170
The use of an acetylene gas lamp for the destruction of insects, R. Roger 170
How insects affect health in rural districts, L. O. Howard 171
The house fly, C. P. Lounsbury 171
The humblebee, A. Gale 171
The apiary, J. Fixter 171
Bees, S. A. Bedford 171
Treatment of foul brood with essence of rosemary, E. E. Bochatey 171

FOODS—NUTRITION.

Nutritive value of alcohol, W. O. Atwater and F. G. Benedict 172
Some new nutrient preparations, S. Weissbein 173
Some new foods prepared from plant protein, M. Wintgen 173
Milk flour in Sweden, V. E. Nelson 173
Milk flour in Sweden, R. S. S. Bergh 173
Edible fungi, A. Zega 173
On the composition of the nuts of *Gingko biloba*, U. Suzuki 173
Cane sugar in seeds of *Gingko biloba* and *Camelia theifera*, U. Suzuki 173
Wheat and maize starches of commerce, D. Saare 174
The baking quality of wheat and ways of estimating it, A. Maurizio 174
Milling and baking experiments with domestic and foreign wheat, M. Fischer . 174
Losses in cooking meat, H. S. Grindley 174
The manufacture of preserves, P. Degener 174
The making of jelly from the fruit of *Pyrus baccata*, W. Saunders 174
Should milk be boiled? W. B. Ransom 174
Variations in body temperature with regard to effect produced on man by reversal of ordinary method of living, F. G. Benedict and J. F. Snell 174
Vegetarian diet and the production of work, Baelz 174
Diet in the several periods of life, E. Palier 175
The dietary of the Scottish peasant, W. G. Little 175
Utilization of sugars (hexoses) by the body, Charrin and Brocard 175
The digestion of carbohydrates in the stomach by ptyalin, Hensay 175
Influence of fats and carbohydrates on protein metabolism, T. W. Tallqvist .. 175
Special rôle of carbohydrates in assimilation of insoluble salts, L. Vaudin 175
The effect of boric acid on the metabolism of man, M. Rubner 175
Effects of forced feeding, N. D. Bardswell et al 175
The amount of combined pentoses in the body, G. Grund 175
The silica content of animal and human tissues, H. Schulz 176

ANIMAL PRODUCTION.

Spontaneous combustion of alfalfa, H. M. Cottrell 176
On the changes in the composition of roots during storage, F. T. Shutt 176
Fodders and feeding stuffs, F. T. Shutt 176
Compilation of analyses of fodder articles, E. B. Holland and P. H. Smith, jr. 177
Corn by-products—gluten meal, gluten feed, etc., F. T. Shutt 177
Cattle-feed inspection, J. B. Lindsey 177
Digestibility of American feed stuffs, J. B. Lindsey and N. J. Hunting 177
Distillery refuse, Dietrich 177
Panicum grass better than sorghum, D. C. Shorey 177
The exact calculation of balanced rations, J. T. Willard 177
Cleavage of fat by micro-organisms, K. Schreiber 177
Proof that resorption of fat takes place in aqueous solutions, E. Pflüger 177

Page.
Concerning pepsin, C. A. Pekelharing 177
Movements of intestines studied by means of Röntgen rays, W. B. Cannon... 177
Digestion in the small intestine, F. Kutscher and J. Seemann 178
Metabolism of phosphorus, calcium, and magnesium by herbivora, F. Tangl.. 178
Concerning the metabolism of horses, T. Pfeiffer 178
Remarks on Pfeiffer's criticisms, N. Zuntz and O. Hagemann 178
Steer feeding experiments, J. H. Grisdale 178
Steer feeding; dehorning, R. Robertson, S. A. Bedford, and A. Mackay..... 178
The cost of beef, H. M. Cottrell 179
Argentina as a market for pure-bred cattle from the U. S., D. E. Salmon..... 179
Mexico as a market for pure-bred beef cattle from the U. S., D. E. Salmon ... 179
Some experiments with beet pulp as a stock food, C. D. Smith 179
Sheep, J. H. Grisdale..... 180
Sheep, R. Robertson..... 180
Swine, J. H. Grisdale..... 180
Pigs, R. Robertson, S. A. Bedford, and A. Mackay 180
Further experiments on different methods of preserving pork 180
Report of the poultry manager, A. G. Gilbert 180
Report of cooperative experiments with egg preservatives, W. R. Graham.... 181
Poultry, R. Robertson, S. A. Bedford, and A. Mackay 181
The digestibility of maize by chickens, S. Paraschtschuk..... 181
The intestinal bacteria of chickens, M. Rubner 181
The value of intestinal bacteria in nutrition, II, M. Schottelius 181
Robinson method of breeding squabs, E. C. Rice 182

DAIRY FARMING—DAIRYING.

Feeding experiments with dairy cows, C. D. Smith 182
Feeding trials with dairy cows, D. A. Gilchrist and A. C. Hall 182
Experiments with dairy cattle, J. H. Grisdale..... 182
Dairying in the South, S. M. Tracy 182
Dairy herd records, J. H. Grisdale, R. Robertson, and S. A. Bedford 182
The milk of spayed cows, H. Lermat 182
Composition of the milk of sheep, Trillat and Forestier 183
Skimming qualities of Holstein, Ayrshire, and Jersey milk, J. Mahon 183
Influence of food on the quality of milk, W. E. G. Atkinson 183
Effect of feed on composition of milk and body of butter, J. B. Lindsey et al. 183
Variations in the composition of butter, L. Malpeaux and J. Delattre 183
Effect of variations in ripening and churning of cream, D. A. Gilchrist..... 184
Killing tubercle bacillus in milk, E. Levy and H. Bruns 184
A micrococcus killed at 76° C., H. L. Russell and E. G. Hastings..... 184
Compilation of analyses of dairy products, E. B. Holland and P. H. Smith, jr. 184
Canadian butter as exported, F. T. Shutt 184
Butter and margarin, L. Grandeau 184
Annual report of the experiment station for cheese making at Lodi, 1901..... 184
Annual reports of dairymen's associations of the Province of Ontario, 1901 ... 185
Dairy legislation, J. B. Lindsey 185
Dairy officials, associations, and educational institutions of U. S., 1902..... 185

VETERINARY SCIENCE AND PRACTICE.

Annual report of Massachusetts Board of Cattle Commissioners, A. Peters et al. 185
Annual report of principal of Royal Veterinary College, 1900, J. McFadyean.. 186
Report of the chief inspector of stock, South Australia, C. J. Valentine..... 186
Report of the chief inspector of stock, Queensland, P. R. Gordon..... 187
Report of veterinary service of minister of internal affairs for 1898..... 187
The relationship between human and bovine tuberculosis, J. McFadyean 187
Transmission of tuberculosis through meat and milk, J. J. Repp..... 187
Certificate of health, H. Lermat..... 187
Infectiousness of milk of tuberculous cows, etc., Lydia Rabinowitsch 187
Tubercle bacilli in milk of cows which have reacted to tuberculin but show no clinical symptoms of tuberculosis, R. Ostertag..... 187
Influence of antituberculous serum on tubercle bacillus, F. Arloing 188
The favoring action of antituberculous serum toward infection, F. Arloing.... 188
Value of Arloing-Courmont serum reaction, M. Beck and L. Rabinowitsch.... 188
Actinomycosis, W. Silberschmidt..... 189

Page.
Germination of anthrax spores, R. Weil 189
Demonstration of anthrax bacilli, C. Fraenkel 189
Relation of germicidal power of rabbit serum to anthrax infection, M. Wilde. 190
Epizootic or contagious abortion, J. McFadyean 190
Treatment of contagious mammitis in cows, E. Zschokke 190
Mortality among calves in Munster, E. Nocard 190
Malaria of cattle in Germany, E. Jackschath 191
Description and treatment of scabies in cattle, R. W. Hickman 191
Outbreak of foot-and-mouth disease in Suffolk during 1901, E. J. Cheney 192
Treatment for foot rot, J. Cotton 192
Bots in sheep, J. D. Stewart 192
Immunization against swine plague and hog cholera by proteidin, H. Greither. 192
Pulmonary antisepsis in infectious pneumonia of horses, Pruneau 192
Emergency report on surra, D. E. Salmon, C. W. Stiles, and A. Hassall 192
Cytological modification of the parasitized animal cell, P. Dormoy 193
Notes on parasites, M. G. Tartakovski 193
Method of adhesion of parasitic nematodes to intestinal walls, A. Rizzo 193
The button disease of chickens 193
Vaccination and serum therapy in roup, C. Guérin 193
The relation of the agglutinins to the protective bodies, A. Castellani 194
Reliability of disinfecting by means of formaldehyde, A. Reischauer 194
The grass pea (*Lathyrus sativus*), F. T. Shutt 194
Index-catalogue of medical and veterinary zoology, C. W. Stiles and A. Hassall 194

AGRICULTURAL ENGINEERING.

The engineering of agriculture, O. V. P. Stout 195
Irrigation at the station farm, 1898–1901, A. J. McClatchie 195
Irrigation in the East 195
Irrigation and rice growing in Louisiana 195
Powers and duties of irrigation officials in Colorado, H. N. Haynes 195
Diagrams of mean velocity of water in open channels, I. P. Church 196
Dynamometer tests with farm implements, C. W. Burkett and F. S. Johnston. 196
The cool side of a house in Arizona, S. M. Woodward 196
Ventilation of farm stables and dwellings, J. B. Reynolds 196
Granaries arranged for mechanical handling of the grain, M. Ringelmann 196
The modern silo, C. S. Plumb 196

MISCELLANEOUS.

Agricultural experiment stations and kindred institutions in Europe, C. A. Zavitz 196

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The Editor and H. W. Lawson.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. Beal.
Botany and Diseases of Plants—Walter H. Evans, Ph. D.
Foods and Animal Production—C. F. Langworthy, Ph. D.
Field Crops—J. I. Schulte.
Entomology and Veterinary Science—E. V. Wilcox, Ph. D.
Horticulture—C. B. Smith.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 3.

Page.

Editorial notes: Progress in plant breeding 205
International Conference on Plant Breeding and Hybridization, Walter H. Evans 208
Recent work in agricultural science 223
Notes 306

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

Manual of agricultural chemistry, H. Ingle 223
Rapid volumetric method for determining phosphoric acid, A. L. Emery 223
Determination of phosphoric acid by titration, etc., J. Cézar 223
On the determination of total phosphoric acid in Thomas slag, C. Aschman 223
Influence of potassium ferrocyanid on precipitation of phosphoric acid by ammonium nitromolybdate, A. F. Leuba 223
Double ammonium phosphates in analysis, Martha Austin 224
Rediscovery of process for rendering phosphoric acid available, C. Baskerville 224
Detection of nitric acid in presence of an alkaline ferrocyanid or ferricyanid, A. F. Leuba 224
The determination of organic nitrogen in water, H. Causse 224
New apparatus in water analysis, A. G. Woodman 224
Gluten feeds, determination of fat and acidity, E. Gudeman 224
Glucose determination, E. Gudeman 224
The polarization of fruits, jellies, jams, and honeys, L. M. Tolman 225
On the quantitative separation of maltose and lactose, C. I. Boyden 225
Refractive indices of salad oils, L. M. Tolman and L. S. Munson 225
Effect of mold on composition of oleomargarine and butter, C. A. Crampton 225
Tables for use in determination of fat in cream by Gerber method, A. Hesse 225

BOTANY.

Fieldbook of American wild flowers, F. S. Mathews 225
The cultivated guavas and their botanical differences, J. B. Davy 226
Some Australian vegetable fibers, J. H. Maiden 226
The Geastræ, C. G. Lloyd 226

Page.
The origin of species by mutation, D. T. MacDougal 226
The rheotropism of roots, F. C. Newcombe 226
The transformation of proteids during germination, G. André 226
Observations on transpiration, C. C. Curtis 226
Contribution to the chemistry of chlorophyll, E. Schunck 227
The etiolation of plants, F. Noll 227
The action of light on etiolated plants, H. Ricôme 227
Influence of temperature on absorption of minerals by etiolated plants, G. André 228

METEOROLOGY.

Report of the meteorologist, W. H. Bishop 228
Meteorological tables, T. S. Outram 228
Rainfall variations 228
Black rain in North Carolina, C. Baskerville and H. R. Weller 229
Cyclones and agriculture, L. Dumas 229

WATER—SOILS.

Waters 229
The purification and sterilization of water, S. Rideal 229
Subterranean hydrology of the region of Cadereyta Méndez, J. DeD. Villarello 229
Soil analyses, C. L. Penny 229
The soils of Dorset, D. A. Gilchrist and G. A. Luxmoore 230
Gooselands of Glenn and Colusa counties, California, R. H. Loughridge et al 230
Study of the climate and soil of the Polder region of Belgium 230
Investigation of soil sediments with regard to plant-food value, L. M. Tolman 230
Action of fertilizer salts on physical properties of soils, A. Mitscherlich 230
The sugar beet as a reclaimer of arid and alkali regions, H. C. Myers 231
Studies on distribution of lime in soils of vineyards, J. Dufour and H. Faes 231
Occurrence and importance of soluble manganese salts in soils, E. E. Ewell 231
Agriculture in its relations to bacteria and other ferments, H. W. Wiley 231
Nitrates in cultivated soils, F. H. King and A. R. Whitson 231
Determination and composition of humus, and its nitrification, C. Rimbach 231
Studies in soil bacteriology, F. D. Chester 232
Elements of agricultural geology, P. McConnell 232

FERTILIZERS.

A study of the phosphorus nutrition of plants, T. Schloesing, jr 233
The fertilizing value of deep stall and yard manure, M. Gerlach 233
Action of nitrates and Alinit in presence of coarse manures, M. Gerlach 233
Effect of manuring on milling property of grain, F. B. Guthrie, G. W. Norris 233
Preservation of manure with superphosphate-gypsum, etc., T. Pfeiffer et al 233
Conservation of cow dung, D. N. Mookerji 234
On sawdust as fertilizer, G. Loges 234
Chemical-agricultural investigations on fertilizing value of beans, E. de Cillis 234
Studies in denitrification, E. B. Voorhees 234
By-product of ammonia and soda manufacture as fertilizers, A. M. Grimm 234
On the use of calcium carbid residue in agriculture, M. Gerlach 234
Analyses of commercial fertilizers and manurial substances, C. A. Goessmann 234
Analysis of commercial fertilizers, J. L. Hills, C. H. Jones, and B. O. White 234
Licensed commercial fertilizers, F. W. Woll and A. Vivian 235
Fertilizers, T. Macfarlane 235
Results of fertilizer control, 1900–1901, G. Thoms 235

FIELD CROPS.

The California Culture substations, C. H. Shinn 235
Fertilizer experiments, C. H. Shinn 236
Report on cultural tests in 1900, A. Damseaux 236
Cooperative field trials with cereals, potatoes, etc., in Norway, B. Larsen 236
Analyses of root crops at different times during storage, H. P. Larsen 236
Chemical composition of some leguminous plants, H. G. Söderbaum 236

Page.
Barley, L. Grandeau 237
Fertilizers for barley, L. Grandeau 237
Observations on the culture of beets, Berthault and Brétignière 237, 238
Influence of distance between plants in row on yield of forage beets 238
Influence of distance on yield and quality of fodder beets, A. von Kötteritz 239
Comparison of forage beets with varieties of a medium sugar content, Desprez 239
Broom corn, W. R. Dodson 239
The improvement of the castor plant, W. R. Shaw 239
The culture of the castor bean in Algeria, C. Rivière 239
Cotton culture, C. Farmer 239
The cowpea 239
Cowpeas, soy beans, and winter vetch, J. D. Towar 239
Alfalfa, cowpeas, and clover as factors in reducing feed bills, A. T. Neale 239
Study of Getty's method of raising cowpeas for silage purposes, A. T. Neale 239
The depth of plowing in flax culture, Kuhnert 240
Hemp from the higher latitudes cultivated in France, E. Gain 240
Grasses and clovers in Idaho, H. T. French 240
Vermont grasses and clovers, L. R. Jones 241
Economic notes on some of the grasses of southwest Missouri, S. A. Hoover 241
Kentucky forage plants, H. Garman and A. M. Peter 241
Kentucky blue grass seed, A. J. Pieters and E. Brown 241
The use of corn fertilizers on meadows, E. Zacharewicz 241
The time of applying potash salts on moorland meadows, B. Tacke 241
Experiments with oats, J. N. Harper and A. M. Peter 242
Fertilizers for oats, L. Grandeau 242
Plant breeding, M. Fisher 242
Variety and fertilizer tests with potatoes, W. J. Green and C. W. Waid 242
Variety tests of potatoes, E. Gross 243
Potato experiments at Garforth, R. S. Seton 243
Sand lucern, J. D. Towar 243
Sorghum in 1901, C. L. Penny 243
Beets and sorghum compared on the basis of sugar production, A. T. Neale 243
The sugar beet in Delaware, A. T. Neale 243
Sugar-beet experiments, C. L. Penny 244
Sugar-beet experiments in 1901, J. D. Towar 244
The influence of lack of plant food on the sugar beet 245
Green manuring for sugar beets, H. Briem 245
History of sugar-beet culture and beet-sugar manufacture in France, J. Helot 245
Experiments in cultivating sugar cane, W. C. Stubbs 245
Fertilizing experiments with sugar cane, J. D. Kobus 246
New method of preserving sweet potatoes, J. S. Newman and J. S. Pickett 246
Tobacco culture on the east coast of Sumatra, W. Westerman 247
Sumatra tobacco, H. Dentz 247
Fertilizers for tobacco, P. Wagner 247
The soverane herbe; a history of tobacco, W. A. Penn 247

HORTICULTURE.

Field experiments with nitrate of soda on market garden crops, E. B. Voorhees 247
Home grown *v.* purchased seed, W. C. Stubbs, F. H. Burnette, and E. Watson 249
Preliminary account of variation in bean hybrids, R. A. Emerson 249
Investigation as to cause of pithiness in celery, E. P. Sandsten and T. H. White 250
Experiments in hybridizing 251
The book of vegetables, G. Wythes 251
The agave; memoir on its culture and the value of its products, J. C. Segura 251
Report of the horticulturist, G. H. Powell 252
Deciduous fruits at and near the Southern Coast Range Substation, C. H. Shinn 252
Thinning fruits, E. P. Sandsten 253
Improving an orchard, F. W. Card 253
Value of improved methods in the propagation of fruit trees, G. T. Powell 253
Renewal pruning, E. S. Goff 253
Two new apricots, P. Mouillefert 254
Stringfellow method of planting peach trees, H. M. Collingwood 254
Moderate *v.* severe thinning of peaches, A. T. Jordan 254
Fertilizer experiments with sour cherries and plums 254
Notes on strawberries, H. C. Price and E. E. Little 254

Page.
Some strawberry books, C. H. Payne 254
The cranberry industry 255
Field grafting and bench grafting 255
Stocks for calcareous soils, L. Ravaz 255
Electricity for cultivation of plants 255
Instantaneous bleaching liquid for nuts, G. E. Colby 255
Distribution of seeds, plants, cuttings, etc., E. J. Wickson 255

FORESTRY.

Handbook of the trees of New England, L. L. Dame and H. Brooks 256
The California forestry substations, C. H. Shinn 256
Forestry in Iowa, W. Greene 256
Trees of the Big Horn forest reserve, A. Estella Paddock 257
Trees of the Priest River forest reserve, J. C. Blumer 257
Special report of the forestry bureau, Philippine Islands, G. P. Ahern 257
Forestry in Saxony, E. L. Harris 257
Report on forest administration in Burma for 1900–1901 257
Report on forest administration in the Punjab for 1900–1901, C. F. Elliott 258
Report of forest administration in the Hyderabad district, C. Bagshawe 258
City forestry, L. A. Goodman 258
Winter aspect of the woods, Charlotte M. King 258
The cork oak, J. H. Maiden 258
The comparative temperature of birch, fir, and pine, V. T. Luguinine 258

SEEDS—WEEDS.

Annual report of the seed-control station at Vienna, T. von Weinzierl 259
Plants injurious in agriculture and horticulture, E. Menault and H. Rousseau 259
The broom rapes, R. Roger 259
Broom rape, G. Martinet and A. Estoppey 259
Dodder—its life history and remedies, D. McAlpine 259
The destruction of mustard by spraying, F. Smeyers and J. Vandervaeren ... 260
Experiments on the destruction of charlock by spraying 260
A brier and blackberry bush eradicator, H. W. Potts 260

DISEASES OF PLANTS.

Report of the mycologist, F. D. Chester 260
Notes and observations on plant diseases, 1901, J. Percival 261
Plant diseases, G. Massee 261
New heterœcious rust fungi, H. Klebahn 261
On hot-water treatment of cereal grains for prevention of smut, H. Rommetin 262
The difference between smut and bunt, E. Druce 262
The wilt disease of the cowpea and its control, W. A. Orton 262
A cowpea resistant to root knot, H. J. Webber and W. A. Orton 262
A new disease of potato, S. Guéraud de Laharpe 263
A new disease of potato, R. Roger 263
The brown disease of potatoes, C. E. Bessey 263
The snow mildew, P. Sorauer 263
A new parasite of sugar beets in Egypt, V. Mosseri 263
Diplodia cacaoicola, a parasitic fungus on sugar cane and cacao, A. Howard ... 263
Observations on the mosaic disease of tobacco, A. F. Woods 264
Black rot of ginger, A. Howard 264
A new banana disease in Egypt, A. Preyer 264
Observations on the mulberry dwarf troubles, U. Suzuki 264
Experiments in the prevention of Peronospora of grapes, F. Zweifler 265
Coulure, or non-setting of grapes, E. H. Rainford 265
The American gooseberry mildew in Ireland, E. S. Salmon 265
Diseases of the tea plant, G. Delacroix 265
The parasites of the tea plant, A. Zimmermann 265
Diseases of timber, H. von Schrenk 266
The disease of larch, J. Simpson 266
A disease of the American ash, H. von Schrenk 266
Carnation anthracnose, M. C. Cooke 266

Page.
Sterilized soil for carnation stem rot, W. R. Pierson 266
Fungus pests of the carnation family, M. C. Cooke 266
Observations on the bacterial rot of the calla lilly, C. O. Townsend 266
The toxic properties of some copper compounds, J. F. Clark 267

ENTOMOLOGY.

Some insects of the year 1899–1900, C. Fowler 267
Some insects of the year 1901, R. H. Pettit 267
Insect record for 1901, C. M. Weed 268
Report of the entomologist, E. D. Sanderson 268
The resisting power of insects, C. Sterne 269
Insects injurious to tobacco in the Island of Réunion, E. Bordage 269
The sugar-cane borer, H. Maxwell-Lefroy 269
The natural enemy of the sugar-cane beetle in Queensland, W. W. Froggatt 270
A parasite of sugar-cane beetle grubs, H. Tryon 270
The chinch bug, J. M. Stedman 270
The squash bug, C. M. Weed and A. F. Conradi 270
Experiments with insecticides for the San José scale, S. A. Forbes 270
A scale insect infesting the fig tree, and its enemies, Trabut 271
The grapevine and *Cœpophagus echinopus*, S. Jourdain 271
Destruction of grapevines by *Cœpophagus echinopus*, L. Mangin and P. Viala 271
Trap lanterns, or "moth-catchers," M. V. Slingerland 272
Suggestions for insect control in the West Indies, H. Maxwell-Lefroy 272
Circular to nurserymen relating to shipment of nursery stock, W. B. Alwood 272
The salt marsh mosquito (*Culex sollicitans*), J. B. Smith 273
The maggot fly, C. Fuller 273
The distance apart at which apiaries should be placed, De Soignie 273
The relationship of honey to wax, C. P. Dadant 273
Do bees injure fruit? 273
Sericulture, J. Bolle 273
Sericulture in Tunis, F. Verry 274

FOODS—NUTRITION.

Human food investigations, H. Snyder 274
Report on a standard emergency ration, M. E. Jaffa 276
The diet of native laborers, J. M. Orpen 277
Hygiene of food and digestion, H. Staedtler 277
Effect of fineness of division and of cooking food upon its digestibility, K. B. Lehmann, F. Meyer, and M. Götz 277
Testing the baking quality of flour, G. Barth 277
A study of the banana and its future possibilities, G. C. Nuttall 277
Toxic and injurious properties of certain coal-tar colors, G. W. Chlopin 277
Inspection and analyses of foods, M. A. Scovell and R. M. Allen 277
Use of serum diagnosis in examination of foods, G. V. Rigler 278
Serum agglutination and its value for examination of meat, Miessner and Herbst 278
A new method of preserving eggs 278

ANIMAL PRODUCTION.

Preliminary report on steamed silage, J. Withycombe and A. L. Knisely 278
Keeping qualities and properties of peat-molasses feeds, A. Herzfeld et al 278
The rôle of sugar in nutrition, L. Grandeau 279
Food value of pie melons, M. E. Jaffa 279
Foods, feeding stuffs, and fertilizers, M. E. Jaffa 279
Analyses of commercial feeding stuffs, H. J. Wheeler and A. W. Bosworth 279
Licensed concentrated feeding stuffs, F. W. Woll and A. Vivian 279
Experiments in wintering and fattening steers, H. J. Waters 279
Feeding problem this winter, H. J. Waters 280
Steer feeding, H. T. French 281
Sheep-feeding experiments, W. J. Kennedy and F. R. Marshall 281
Feeding lambs, H. T. French 282
The food value of sugar beet, A. D. Hall 283
A comparison of feeds for pigs, D. W. May 283
Growing swine of various breeds and crosses, T. Shaw 284

Pag

Molasses as a food for army horses, G. E. Griffin 2
Poultry feeding, H. J. Wheeler 2
Plump *v.* shrunken wheat as food for laying hens, M. E. Jaffa 2

DAIRY FARMING—DAIRYING.

Soiling crop experiments, C. B. Lane 2
Cost of raising heifers, A. T. Neale 2
A new method of milking, J. J. Hegelund 2
The new method of milking, C. Söndergaard 2
The Hegelund method of milking, J. O. Aashamar 2
Report on the churnability of cream, E. Mathews 2
Payment for milk according to analysis in Belgium, G. E. Lloyd-Baker 2
A note on the fat globules in milk, F. J. Lloyd 2
Stagnant water germs in milk, E. F. Pernot 2
The milk supply of London, R. W. Woosnam 2
Testing milk and cream, F. L. Kent 2
Testing skim milk by the Babcock test, F. W. Woll 2
Spontaneous decomposition of milk at 40–44° C. and the micro-organisms concerned, M. Ferguson 2
Studies on the causes of rancidity of butter, O. Jensen 2
Lactic acid ferments and the ripening of cheese, E. von Freudenreich 2
Presence and development of Tyrothrix bacilli in cheese, G. Troili-Petersson 2
Acid and rennet producing bacteria in milk, C. Gorini 2
Duration of life of bacillus of tuberculosis in cheese, F. C. Harrison 2
Dairying in Australia 2
Cheese, butter, and condensed milk, factory product, H. E. Alvord 2

VETERINARY SCIENCE AND PRACTICE.

Study of the hemolytic cytase in the plasma of normal animals, C. Levaditi 2
Concerning infection from the uninjured conjunctival sac, K. Hirota 2
Influence of low temperatures upon pathogenic bacteria, C. M. Belli 2
Blood and serum preserved in an aseptic manner, M. Doyon and A. Morel 2
Immunity and protective inoculation, A. T. Kinsley 2
Experiments in the transmission of leprosy to animals, Y. Tashiro 2
The trypanosoma of nagana or tsetse-fly disease, A. Laveran and F. Mesnil 2
The tsetse-fly disease, A. Theiler 2
Action of human serum on the trypanosoma of tsetse-fly disease, A. Laveran 2
The surra disease of cattle and horses in the Protectorate of Togo, Schilling 2
Texas fever, Claude and Soulié 2
A second note on Texas fever, M. Nicolle and Adil-Bey 2
The Queensland redwater immune cattle for South Africa 2
The etiology of rinderpest, Nicolle and Adil-Bey 2
Studies on rinderpest, M. Nicolle and Adil-Bey 2
Modifications of the leucocytes in rinderpest, Réfik-Bey 2
A contribution to the tuberculosis problem, K. Müller 2
The prevention of bovine tuberculosis, H. Raquet 2
How to get rid of tuberculosis in cattle, W. C. Edwards 2
Remarks on the relations of human and bovine tuberculosis, C. H. Cattle 2
Tuberculosis, Liebner 2
Tuberculosis in sheep, A. G. R. Foulerton 2
Infection of swine with tuberculosis, S. Stewart 2
A case of tuberculosis of the lungs in *Ursus malayanus*, K. Geisenberg 2
Tuberculosis in cold-blooded organisms, H. Herzog 2
A disease of the extremities observed in young cattle in South Africa, O. Voges 2
Carcinoma of the eye in cattle, O. Voges 2
Study of sorghum poisoning in cattle, A. Peters 2
A study of the enzyms of green sorghum, H. B. Slade 2
A poisonous plant—the common horsetail, F. A. Rich and L. R. Jones 2
Experiments with malarial catarrhal fever of sheep, Spreull 2
Reindeer plague and the pathogenic bacillus of this disease, A. M. Bergman 2
Normal serum in hog cholera, S. Saltykow 3
The problem of the differential diagnosis of glanders, B. S. Trofimov 3
Diseases of the horse which are grouped together under influenza, Dieckerhoff 3
Pneumonia of horses, Iwersen 3

Page.
Experiments in artificial transmission of pneumonia of horses, C. Troester 300
The South African horse disease, Kaesewurm 300
An epizootic of herpes, Christiani 301
Treatment of morbus maculosus with 10 per cent iodin-vasogen, Straube 301
Antistreptococcic serum for contagious coryza and morbus maculosus, Maier .. 301
Common parasites of domestic animals, L. L. Lewis 301
Intravenous injections of corrosive sublimate, A. Serafini 301
Farm management of germ diseases, J. J. Repp 302

AGRICULTURAL ENGINEERING.

Sanitary engineering, F. Wood 202
Irrigation farming, L. M. Wilcox 302
Irrigation in humid climates, C. S. Phelps 302
Irrigation 303
Reclaiming the arid Southwest, R. M. Barker 303
Prevention of pollution of streams by modern methods of sewage treatment, L. P. Kinnicutt 303
Influence of height of wheel on the draft of farm wagons, T. I. Mairs 303
Agromotive, E. Deligny 303
Refrigerating machines, H. d'Anchald 303
The ventilation of stalls, R. Preuss 303

MISCELLANEOUS.

Agricultural experiment stations in foreign countries, A. C. True and D. J. Crosby 304
Our foreign trade in agricultural products, 1892–1901, F. H. Hitchcock 304
Agricultural imports of the United Kingdom, 1896–1900, F. H. Hitchcock 305
Suggestions to pioneer farmers in Alaska, C. C. Georgeson 305
Agricultural monograph of the Polder region of Belgium 305
Teaching agriculture in Germany, II, J. Vandervaeren 305
Teaching agriculture in Austria, J. Vandervaeren 305
Practical agriculture, C. C. James 305
Practical manual for the farmer, L. Beuret and R. Brunet 305

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Alaska Stations: Page.
Bul. 1 305
California Station:
Bul. 141, June, 1902 252
Rpt. 1899–1901, pt. 1 ..... 226, 229, 230, 231, 235, 236, 255, 256, 267, 276, 279, 285, 303
Delaware Station:
Bul. 55, May 1, 1902 239
Thirteenth An. Rpt., 1901 ... 228, 229, 232, 239, 243, 244, 252, 260, 268, 286, 304
Idaho Station:
Bul. 32, Apr., 1902 ..... 281, 282
Bul. 33, May, 1902 240
Illinois Station:
Bul. 71, Apr., 1902 270
Bul. 72, May, 1902 270
Iowa Station:
Bul. 62, Dec., 1901 259
Bul. 63, May, 1902 281
Bul. 64, May, 1902 254
Biennial Rpt., 1900–1901 304
Kentucky Station:
Bul. 98, Feb. 25, 1902 241
Bul. 99, Apr., 1902 242
Bul. 100, Feb., 1902 277
Bul. 101, May 20, 1902 283
Louisiana Stations:
Bul. 66 (second series), 1901 . 245
Bul. 67 (second series), 1902 . 239
Bul. 68 (second series), 1902 . 249
Maryland Station:
Bul. 82, May, 1902 253
Bul. 83, May, 1902 250
Massachusetts Station:
Bul. 83, July, 1902 234
Michigan Station:
Bul. 197, Feb., 1902 244
Bul. 198, Mar., 1902 243
Bul. 199, Apr., 1902 239
Bul. 200, May, 1902 267
Minnesota Station:
Bul. 73, Mar., 1902 284
Bul. 74, Apr., 1902 274
Ninth An. Rpt., 1901 ..... 228, 304

Stations in the United States—Cont'd.

Missouri Station: Pa
Bul. 51, July, 1902 .....
Bul. 52, Oct., 1901 .....
Nebraska Station:
Fifteenth An. Rpt., 1901 . 249, 298,
New Hampshire Station:
Bul. 89, Feb., 1902 .....
Bul. 90, Mar., 1902 .....
New Jersey Stations:
Bul. 157, May 12, 1902 .....
Bul. 158, June 11, 1902 .....
Bul. T, July 8, 1902 .....
New York Cornell Station:
Bul. 202, June, 1902 .....
Ohio Station:
Bul. 133, Mar., 1902 .....
Oklahoma Station:
Bul. 53, June, 1902 .....
Bul. 54, June, 1902 .....
Oregon Station:
Bul. 70, May, 1902 .....
Bul. 71, June, 1902 .....
Bul. 72, June, 1902 .....
Rhode Island Station:
Bul. 83, Mar., 1902 .....
Bul. 84, Apr., 1902 279,
South Carolina Station:
Bul. 71, May, 1902 .....
Vermont Station:
Bul. 93, May, 1902 .....
Bul. 94, May, 1902 .....
Bul. 95, June, 1902 .....
Virginia Station:
Special Bul., May 31, 1902 ...
Wisconsin Station:
Bul. 92, Apr., 1902 235,
Bul. 93, May, 1902 .....

U. S. Department of Agriculture.

Bureau of Plant Industry:

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The Editor and H. W. Lawson.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. Beal.
Botany and Diseases of Plants—Walter H. Evans, Ph. D.
Foods and Animal Production—C. F. Langworthy, Ph. D.
Field Crops—J. I. Schulte.
Entomology and Veterinary Science—E. V. Wilcox, Ph. D.
Horticulture—C. B. Smith.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 4.

Editorial notes: Page.
Dr. Robert C. Kedzie, a pioneer in agricultural science 309
New yearbook of the Russian experiment stations 311
Convention of Association of American Agricultural Colleges and Experiment Stations, D. J. Crosby 313
Recent work in agricultural science 326
Notes 409

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

The nucleic acid of the wheat embryo, T. B. Osborne and I. F. Harris 326
On the determination of phosphoric acid in plants, G. Sokolov 327
Chemical methods of determining the productiveness of soils, K. K. Gedroiz 327
Amount of hydrochloric acid required for digestion of soils, P. Kossovich 327
On the question of the determination of humus in soils, P. Kossovich 327
The determination of lime and magnesia in water, A. Grittner 327
The determination of nitric acid in water, R. Woy 328
Rapid estimation of boric acid in butter, H. D. Richmond, J. B. P. Harrison 328
Determination of lecithin in milk, F. Bordas and S. de Raczkowski 328
Department of chemistry, A. L. Knisely 328
On a new acid indicator, L. J. Simon 328
A vacuum desiccator heated by regulated incandescent lights, A. Skita 328
Agricultural chemistry in the nineteenth century, W. Frear 328

BOTANY.

Page
The relation of nutrition to the health of plants, A. F. Woods 32
Investigations on the utilization of ternary compounds by plants, P. Mazé 32
Cane sugar as a reserve material in phanerogams, E. Bourquelot 32
Starch of evergreen leaves and its relation to photosynthesis, K. Miyake 32
Photosynthesis in light rays of different wave lengths, A. Richter 32
The transformation of oil in seed during their germination, P. Mazé 33
The growth of alfalfa in noncalcareous soils, P. P. Dehérain and E. Demoussy 33
Comparative resistance to high temperatures of fungus spores, Abigail O'Brien 33
The digestion of mannane in the tubercles of orchids, H. Hérissey 33
The endophytic fungi of orchids, G. T. Grignan 33

FERMENTATION—BACTERIOLOGY.

Diagnosis of bacteria, T. Matzuschita 33
Treatise of bacteriology, P. Miquel and R. Cambier 33
Composition of albuminoids and cell membranes of fungi and bacteria, K. S. Iwanoff 33
Denitrification, H. Weissenberg 33
Department of bacteriology, E. F. Pernot 33
Report of Moscow Bacteriological Agricultural Station for 1901, S. Severin 33
The relation between the so-called Alinit bacteria, *Bacillus ellenbachensis*, *B. megatherium*, and *B. subtilis*, B. Heinze 33
Nitrogen assimilating bacteria, Gerlach and Vogel 33
Notes and observations on nitrifying bacteria, R. Helms 33
The aerobic retting of flax, L. Hauman 33
A variety of hog-cholera bacillus closely resembling *Bacillus typhosus*, M. Dorset 33
Oysters and sewage in Narragansett Bay, C. A. Fuller 33
Observations on *Bacillus coli communis*, V. A. Moore and F. R. Wright 33
Apparent identity of the cultural reactions of *Bacillus coli communis* and certain lactic bacteria, S. C. Prescott 33
Toxicity of water toward pathogenic bacteria, H. L. Russell 33
Effect of low temperatures upon pathogenic organisms, C. M. Belli 33
On the germicidal action of the organic peroxids, F. G. Novy and P. C. Freer 33
Tryptophane in proteolysis, S. H. Vines 33
The symbiosis between Amylomyces and a species of Micrococcus, P. Vuillemin 33
Action of tannin and coloring matter on the activity of yeasts, A. Rosenstiehl 33
Notes on the enzyms of the Japanese sake-yeast, T. Takahashi 33
New form of incubator and thermoregulator for bacteriological work, H. F. Ward 33

ZOOLOGY.

A biological investigation of the Hudson Bay region, E. A. Preble 33
The prairie dog of the Great Plains, C. Hart Merriam 33
Killing woodchucks with carbon bisulphid, C. M. Weed 33
The suslik in Germany, A. Jacobi 33
Ravages of rabbits in Germany and experiments in their control, A. Jacobi and O. Appel 33
Combating the mouse pest by means of the bacillus of Mereshkowski, Y. Kozai 33
Resistance of rats to carbonic and sulphurous acids, J. P. Langlois and A. Loir 33
Protection of useful birds, C. W. Peterson 33
Necessity for the preservation of our insect-destroying birds, C. French 33
Two vanishing game birds—the woodcock and the wood duck, A. K. Fisher 33
The winter habits of the red-headed woodpecker, H. A. Winkenwerder 33
Regulations for importation of eggs of game birds for propagation, J. Wilson 33
Interstate commerce in birds and game, J. Wilson 33
Importation of reptiles into Hawaii, J. Wilson 33
Zoological yearbook for 1901, P. Mayer 33

METEOROLOGY—CLIMATOLOGY.

The Chinook winds, A. T. Burrows 33
Sun spots and wind, A. B. MacDowall 33
Meteorological observations, C. B. Ridgaway 33
Comparison of temperature and rainfall of 1900 with previous years, E. R. Demain 33

Page.
The decrease of temperature with altitude, M. Moreno y Anda 339
Daily variations in meteorological elements of atmosphere, L. Teisserenc de Bort 339
Hail shooting in Lower Austria, 1900–1901, J. von Jablanczy 339
Firing to prevent hail, E. Vidal 339
Fog studies, A. G. McAdie 339
Short period solar and meteorological variations, N. and W. Lockyer 339
The atmosphere, J. W. Lee 339
A new organic gas of the atmosphere, H. Henriet 339
Verification of the law of barometric heights, W. de Fonvielle 339
Observations on the climatology of Mexico, T. L. Laguerenne 339

WATER—SOILS.

Experiments in evaporation, C. B. Ridgaway 339
The progress in the field of chemistry of waters, A. Goldberg 340
The bacteriological analysis of drinking waters, Bordas 340
Report for 1901 of the Agricultural Experiment Station of Ploti 340
On the question of the productiveness of different soil layers, S. Stschussev 341
Comments on the above paper, D. Rudsinsky 341
On the water-soluble phosphates of the soil, T. Schloesing, jr 341
Influence of frost on the physical properties of soils, A. Mitscherlich 341
On the question of the mechanical analysis of soils, P. Kaschinsky 341
Vegetation boxes for studying the water content of soils, C. von Seelhorst 341
Analysis of the soil by the plant, T. Lokot 341
Nitrifying ability of normal soils and loss of nitrates, A. V. Klyucharev 342
The crop and the soil in their mutual relations, S. Bogdanov 342
Practical experiments in the restoration of worn-out soils, R. F. Schwarz 342
The purpose of a soil survey, M. Whitney 342

FERTILIZERS.

The action of the solid constituents of stall manure, M. Gerlach 342
A new method of conserving manure and urine, P. Rippert 342
Manures and manuring, O. Lemmermann 343
Commercial fertilizers, W. W. Miller and N. W. Lord 343
Analysis of commercial fertilizers sold in Maryland, H. B. McDonnell et al 343
Fertilizer analyses, R. C. Kedzie 343
Availability for plants of phosphoric acid of mineral phosphates, P. Kossovich 343
Relation between amounts of phosphoric acid and ammonia in plants, H. Pellet 343
Ammonia salts as a source of nitrogen for plants, P. Kossovich 343
The solvent action of ammonia salts on phosphorites, I. Shulov 343
The action of nitrogen in absence of other nutritive substances, H. Wilfarth 344
Effect of nitrates and humus on nitrogen assimilation, F. Nobbe and L. Richter 344
Perchlorate of potash in plant growth, L. Grandeau 344

FIELD CROPS.

Influence of environment on the chemical composition of plants, H. W. Wiley 344
Influence of fertilization on roots of different plants, C. von Seelhorst 345
Relation of different crops to water content of the soil, C. von Seelhorst 345
Progress in plant and animal breeding, W. M. Hays 346
The length of the growing season in North Dakota, E. F. Ladd et al 346
Annual report of Burdwan Experimental Farm for 1900–1901, D. N. Mookerji 346
Experiments with field crops 346
Report on work at Provincial Experimental Garden at Ghent, P. de Caluwe 346
The management and improvement of the range, E. Nelson 347
Development of roots and shoots from the nodes of cereals, C. von Seelhorst 347
The influence of fertilizers on the form of cereal plants, H. Clausen 347
Changes of nitrogenous substances in cereals during ripening, N. Nedokutschajew 347
Alfalfa, F. E. Emery 347
Breeding and cultivation of barley for brewing purposes, Remy 347
The culture of forage beets in different sections of France, P. P. Dehérain 347
Forage beet culture at Grignon in 1900 and 1901, P. P. Dehérain and C. Dupont 348

Page.
Culture tests with red clover, O. Burchard 348
Experiments with gypsum on clover and vetch, J. Withycombe 348
Fertilizer, culture, and variety tests with corn and cotton, B. W. Kilgore et al 348
Detasseling corn, A. D. Shamel 348
Number of barren stalks in Illinois cornfields, A. D. Shamel 348
Flax experiments, 1901 348
Experiments with forage crops, T. von Weinzierl 349
Guide to the cultivation, harvesting, and marketing of the ginseng plant 349
The hemp industry in the United States, L. H. Dewey 349
Fertilizer experiments with oats, W. Müller 349
Experiment with winter oats, Schacht 349
Sowing oats and barley at different rates 349
Improving field peas, M. Fischer 350
Effect of different amounts of water on the yield of potatoes, B. P. Fleming 350
Progress of beet-sugar industry in the United States in 1901, C. F. Saylor 350
Influence of weather conditions on sugar-beet crops for 1891–1900, W. Rimpau 351
Instructions for growing sugar beets, C. G. Hopkins 351
Sugar-beet seed, production and testing, A. J. Pieters 351
Variety tests of mangels and sugar beets 351
Fertilizer and variety tests with sugar cane, J. P. d'Albuquerque and J. R. Bovell 351
The culture of sugar cane and sugar beets in Egypt, M. Tinardon 351
Culture and treatment of tobacco by the Neumer method, K. Preissecker 351
Kansas and her wheats 352
Observations on wheat culture in 1902, Desprez 352
Manure experiments with wheat, F. B. Guthrie and R. Helms 352

HORTICULTURE.

A handy book of horticulture, F. C. Hayes 352
Department of horticulture and gardening, G. Coote 352
Electro-culture, S. Lemström 352
Note on some grafting experiments, R. H. Biffen 353
The propagation of plants, L. C. Corbett 353
Comparative study of different colored glass for greenhouses, E. Zacharewicz 354
Forcing tomatoes at the Iowa Experiment Station, H. C. Price 354
Vegetables for a farmer's garden in northern Illinois, J. W. Lloyd 354
Manuring fruit trees, J. P. Wagner 354
Observations on the fertilization of peach orchards, E. H. Jenkins 354
The thinning of fruit, S. A. Beach 355
Culture of the citrus in California, B. M. Lelong 355
Report of the fruit expert, W. J. Allen 355
The farmer's fruit garden, E. V. Stubenrauch 356
Fruits for a farmer's garden of one acre in northern Illinois, W. S. Hotchkiss 356
Little-known fruit varieties worthy of wider dissemination, W. A. Taylor 356
Commercial apple orcharding, G. B. Brackett 356
Grafting resisting apple scions 356
Fruit storage experiments, J. C. Blair 356
Tinting ripe pickled olives, E. W. Hilgard 356
The art of canning and preserving as an industry, J. Pacrette 356
Small fruits for the northern half of Illinois, J. W. Lloyd 356
Strawberry culture in Mississippi, A. B. McKay 356
Growing strawberries under cloth, O. W. Blacknall 357
Houses for strawberry forcing 357
Cranberry culture in southeastern Massachusetts, J. Bursley 357
Grapes, A. Dickens and G. O. Greene 357
Nitrate of soda in the culture of grapes, G. Chappaz 358
Report of the viticultural expert, M. Blunno 358
The home vineyard, with special reference to Northern conditions, W. H. Ragan 358
Budding the black walnut 358
Notes on the caoutchouc trees of the Amazon, J. Huber 358
The ether treatment of lilacs in the trade, F. Ledien 358
Key to garden classification of roses, L. Barron 358
Influence of stock on scion, J. Dallas 358
Horticultural monograph of the genus Deutzia, E. Lemoine 358
Native vines in Wyoming homes, A. Nelson 358
The "why" of the late planting of dahlias, J. W. Withers 358

Page.
A new yellow calla, E. O. Orpet 359
Leaf mold for orchids, E. O. Orpet 360
The farmer's flower garden, A. C. Beal 360
The window garden, A. C. Beal 360

FORESTRY.

Grazing in the forest reserves, F. Roth 360
Administration of the United States forest reserves, I. F. Roth 360
New forest reserves 360
The timber resources of Nebraska, W. L. Hall 360
Forestry in Minnesota, S. B. Green 361
A working plan for southern hard woods, and its results, J. Foley 361
The improvement of uncultivated farm land, E. H. Jenkins 361
Annual report of the forester, W. Mulford 361
Fire and the forest reserves, C. S. Newhall 361
Forest fires during June 361
Practical sylviculture, G. Vert 361
Forest trees adapted to Chile, F. Albert 361
White pine planting in New England, H. B. Kempton 361
The *Pinus attenuata* as a water conserver, T. P. Lukens 362
The red cedar in Nebraska, L. C. Miller 362
Taxodium distichum and related species, R. M. Harper 362
A notable California fir, W. R. Dudley 322
A volatile oil in the wood of *Cryptomeria japonica*, C. Kimoto 362
The effect of lightning on trees, D. T. MacDougal 363
The work in dendro-chemistry, W. H. Krug 363
The lumber industry, H. Gannett 363

SEEDS—WEEDS.

Agricultural seeds—where grown and how handled, A. J. Pieters 363
A test of the vitality of seed corn, A. D. Shamel 364
Tests of the vitality of vegetable seeds, E. H. Jenkins 364
Conditions influencing the vitality and germination of seeds, J. W. T. Duval 364
The removal of the wings from the seeds of conifers, F. Main 364
The destruction of weeds, G. Heuzé 364

DISEASES OF PLANTS.

Notes on plant diseases, F. D. Chester 364
A new bacterial disease of the potato, G. Delacroix 365
Concerning the bacterial disease of the potato, E. Marre 366
Concerning a bacterial disease of the potato, A. Carré 366
Some diseases of the sugar beet, C. O. Townsend 366
Field treatment of cane cuttings in reference to fungus diseases, A. Howard 366
The root disease of sugar cane 366
A foot rot of wheat, A. B. Cordley 367
Inquiry concerning loss from smut of wheat and oats in Illinois, A. D. Shamel 367
The gummosis of fruit trees, P. Passy 367
Field work with bitter rot during 1901, J. C. Blair and A. V. Stubenrauch 367
Prevention of bitter rot, T. J. Burrill and J. C. Blair 367
Cockscomb fasciation of pineapples, J. W. Harshberger 368
Nature of the banana disease prevalent at Alexandria, Looss and G. P. Foaden 368
How fungi gain entrance to living trees, J. W. Harshberger 368
Canker of oak trees, M. C. Potter 368
A bacterial blight of strawberry, A. B. Cordley 368
Experiments for the prevention of mildew, L. Ravaz and A. Bonnet 368
Influence of gray rot of grapes on yield and quality of wine, A. Muntz 369
Development of black rot, A. Prunet 369
The fire disease of narcissus, J. Ritzema Bos 369
Bordeaux mixture containing sugar, and bee culture, E. Jacky 370

ENTOMOLOGY.

Department of entomology, A. B. Cordley 370
Report of the entomologist, R. C. Scheidt 370
Insects, J. M. Southwick 371

Page

The importance of parasitic insects in agriculture, A. Berlese 371
Present status of Mexican cotton-boll weevil in the United States, W. D. Hunter. 371
Spraying tests for codling moth—New Zealand experience 371
Spraying orchards for the codling moth, F. Garcia 371
The apple-tree tent caterpillar, W. E. Britton 371
Some destructive caterpillars, E. D. Sanderson 372
Coccidæ of Japan, S. I. Kuwana 372
The rose scale (*Diaspis rosæ*), J. B. Smith 372
Lime, sulphur, and salt wash for scale insects, C. P. Lounsbury 372
Cyanid-gas remedy for scale insects, C. P. Lounsbury 373
The spraying and cleaning of fruit trees, A. G. Campbell 373
The grass thrips, L. R. Cary 373
Thrips on cocoa 373
Means of combating *Tortrix ambiguella*, H. Grosjean 373
Methods of combating *Cleonus punctiventris*, S. Skrzhinski 373
Botys sticticalis in the summer of 1901, V. P. Pospelov 373
A sawfly on turnips, Bouvier 373
Notes on a Phytoptus, A. Kempel 374
Experimental work with fungus diseases of grasshoppers, L. O. Howard 374
Lantern traps, P. Coste-Floret 374
Spraying for city and country, A. H. Kirkland 374
Directions and formulas for spraying, A. V. Stubenrauch and J. W. Lloyd 374
Spraying calendar, L. R. Taft 374
Hydrocyanic-acid gas against household insects, L. O. Howard 375
Some mosquitoes of Mississippi and how to deal with them, G. W. Herrick 375
The mosquito plague in the City of Mexico in 1901, A. L. Herrera 375
Some parasites of mosquitoes, A. Laveran 375
The sting of certain Hemiptera, R. Blanchard 375
Fowl tick, A. A. Brown 375
Bee culture, C. C. Miller 376
Practical bee keeping, A. E. Manum 376
Long-tongued bees, A. Gale 376
The embryology of the silkworm, K. Toyama 376
Healthy and diseased silkworms, S. Egidio 376

FOODS—NUTRITION.

Cereal breakfast foods, L. H. Merrill and E. R. Mansfield 376
The relative cost of home cooked and purchased food 377
The nutritive value of hens' eggs, G. Lebbin 377
The composition and nutritive value of biltong, W. D. Halliburton 377
Effect of preserving meat by covering it with different salts, P. Kuschel 377
The estimation of the fat content of wheat bread, etc., J. C. Berntrop 377
Commercial wheat and maize starch, O. Saare 378
Composition of hard wheats and constitution of hard-wheat gluten, E. Fleurent. 378
Banana meal, H. H. Cousins 378
Banana flour 378
Cassava, E. Leuscher 378
Composition and nutritive value of certain colonial vegetables, A. de Villèle. 378
Some unusual food plants, Julia D. Chandler 378
On Hamana-natto, a kind of vegetable cheese, S. Sawa 378
Concerning the Japanese nori, K. Oshima and B. Tollens 378
Composition of food from horse chestnuts (*Æsculus hippocastanum*), E. Laves. 379
Chemistry of confectioners' materials and processes, W. Jago 379
Sugar in the diet of man, L. Grandeau 379
Diet in relation to age and activity, Sir Henry Thompson 379
Dietaries in public institutions, W. O. Atwater 379
The physiology of nutrition, H. P. Armsby 379
Food and energy, H. P. Armsby 379
Theory and practice of infant feeding, with notes on development, H. D. Chapin 379
The feeding of infants, J. E. Winters 379
Concerning temperature regulation in new-born infants, E. Babák 379
Second annual report of the State food commissioner of Illinois 379
Sixteenth annual report of the Ohio State dairy and food commissioner 379

ANIMAL PRODUCTION.

Page.
Concentrated feeding stuffs, L. A. Voorhees and J. P. Street 380
Composition of feeding stuffs sold in Connecticut, E. H. Jenkins et al 380
Analysis of feed stuffs sold in Maryland, H. B. McDonnell 380
Modern cattle foods and cattle-food controls, W. Frear 381
Forage from Russian thistles 381
Nutritive value of the Russian thistle, E. H. S. Bailey and C. F. Gustafson 381
Cattle food from sugar cane in the West Indies, G. Sawter 381
Corn as a stock food, H. J. Waters 381
Fenugreek a stock feed 381
Intensive feeding of farm animals with fenugreek seed, Schlagdenhauffen, Reeb 381
Fenugreek, its influence on general nutrition, E. Reeb 381
Depression of digestibility due to an excess of carbohydrates, E. A. Bogdanov 381
Comparison of silage and shock corn for wintering beef calves, H. W. Mumford 381
Factors in beef production, F. B. Mumford 382
Characteristics of the prime steer, H. W. Mumford 382
The characteristics of stockers and feeders, H. W. Mumford 382
A scale of points as a means of judging cattle, etc., A. Lonay 382
Sheep feeding on the range; lamb feeding, second trial, F. E. Emery 382
Breeding experiments with sheep, F. B. Mumford 383
Mohair and mohair manufactures, G. F. Thompson 383
Horse feeding, L. A. Merrill 383
What is a maintenance ration for a horse? F. E. Emery 385
Maintenance ration for driving horse, F. E. Emery 385
The breakage of eggs, H. Faber 385
Eggs of hens fed meat, E. Thierry 386

DAIRY FARMING—DAIRYING.

Alfalfa *v.* wheat bran for milch cows, F. E. Emery 386
The flat pea, its culture and feeding value for milch cows, G. Andrä 386
The use of milking machines in dairying, F. Bordas and S. de Raczkowski 386
The composition of milk, H. D. Richmond 386
The composition of colostrum, W. F. Sutherst 387
Variation in the phosphoric acid in milk during lactation, F. Bordas and S. de Raczkowski 387
The hygiene of milk, W. Stieger 387
The care and handling of milk, O. F. Hunziker 387
Aeration of milk, C. E. Marshall 337, 388
Standard milk and cream, W. J. Fraser 388
Standardization of milk and cream, O. Erf 388
Use of hydrogen peroxid for the preservation of milk, J. Huwart 388
Hydrogen peroxid for preserving milk, R. Lezé 388
The acidity of milk: Its accurate and rapid determination, etc., P. Dornic 388
Composition of separator slime, C. Barthel 388
Study of rapid and slow creaming milks, M. Henseval 388
The influence of creaming on the distribution of the principal constituents of milk, F. Bordas and S. de Raczkowski 389
Study of pasteurization of cream in dairying, L. Marcas and M. Henseval 389
Influence of food on volatile acids in butter, H. Weigmann and O. Henzold 389
Fluorids as butter preservatives, O. and C. W. Hehner 389
The Institute of Butter Control in Friesland, M. Beau 389
Characteristics of butter from human milk, Sauvaitre 389
Estimation of the quantity of casein precipitable by rennet, L. Lindet 389
Influence of low temperatures on the ripening of cheese, E. von Freudenreich 390
Edam cheese, M. Beau 390
Second National Congress of Dairying, M. Henseval 390
Examination of apparatus for testing milk and cream, A. L. Winton 390

VETERINARY SCIENCE AND PRACTICE.

Proceedings of the American Veterinary Medical Association for 1901 390
The duration of the life of pathogenic bacteria in minute particles of water and on dust particles, F. Kirstein 392
Properties and nature of mixtures of toxins and their antitoxins, J. Danysz 392
Agglutination in cases of mixed infection, A. Castellani 393

Page.
Tuberculosis, E. von Behring, P. Römer, and W. G. Ruppel 393
Comparative virulence of human and bovine tubercle bacillus, M. P. Ravenel 394
Influence of toxins of tuberculin, S. Arloing and Descos 395
Chemotactic properties of various tuberculous sera, F. Arloing 395
Contagion and tuberculosis in man and beast, G. F. Keene 396
The possibility of transmission of tuberculosis from man to hogs, M. Tempel 396
Is tuberculosis hereditary? A. van Leeuwen 396
The tuberculin test for tuberculosis, D. E. Salmon 396
British Congress on Tuberculosis, held in London, July, 1901, M. P. Ravenel 396
Diagnosis of anthrax, J. Bongert 396
The disinfection of animal hair by means of steam, Proskauer and Conradi 396
Tick fever or murrain in southern cattle, J. C. Robert 397
Clinical notes on cases of azoturia, hæmoglobinuria, etc., E. J. Thorburn 397
Actinomycosis-like development of bacilli, A. C. Abbott and N. Gildersleeve 397
Intravenous injections and the treatment of aphthous fever, E. Nocard 398
Interim report upon cattle disease in southern Rhodesia, W. Robertson 398
Distomatosis—"the cattle scourge of Connaught," J. Watson 398
Sarcoptic mange of the ox, H. Taylor 398
Algerian sheep in France, and sheep pox, Trabut 398
Demonstration of virulence of blood in sheep affected with pox, F. J. Bosc 398
The virulence of the lymphatic glands in sheep pox, F. J. Bosc 398
External parasites of sheep, F. E. Emery 398
Hog cholera, J. J. Wester 399
Combating infectious diseases of pigs, A. van Leeuwen 399
Conference on inspection of pigs and pig products, W. C. Quinnell et al 399
Method of treating hogs affected with the diamond skin disease, Levy 399
Combating glanders in the horse, V. Babes 399
Mal de Caderas, O. Voges 400
A parasitic disease in horses, mules, and carabao in the Philippines, J. J. Carter 400
Pinkeye, S. Wharam 400
Tetanus in dogs, Ducourneau and P. Jayles 401
The treatment of tetanus, Tennert 401
Malaria of dogs, Nocard and Motas 401
Rabies, M. P. Ravenel 401
Rabies in the government of Moscow, A. Stepanov 401
Reaction of neuroglia to rabies virus in dogs, Anglade and Choucroux 401
Blackhead in turkeys, C. Curtice 402
Notes on the biology of the organism of cyanolophia of fowls, A. Lode 402
Diphtheria of fowls; vaccination; serotherapy, C. Guerin 402
Yellow liver, or congenital functional debility in ostrich chicks, D. Hutcheon 402
A pigeon epizootic, caused by an invasion of *Heterakis perspicillum*, T. Kasparek 402
What ails the chickens? F. E. Emery 402
Insects as carriers and spreaders of disease, L. O. Howard 403
Insects as factors in the transmission of disease, H. Skinner 403

AGRICULTURAL ENGINEERING.

Utilizing our water supply, A. J. McClatchie 403
Development and application of water near San Bernardino, J. B. Lippincott 403
Investigation of the rivers of Ohio as sources of public water supplies, 1901 404
Hydrography of the Southern Appalachian Mountain region, H. H. Prussey 404
Some typical reservoirs in the Rocky Mountain States, E. Mead 404
The Nile reservoir dam at Assuân, and after, W. Willcocks 404
A practical irrigating system, H. M. Albaugh 404
Supplementary report on irrigation in Natal, F. V. Corbett 404
The measurement of water for irrigation, B. P. Fleming 404
Accuracy of stream measurements, E. C. Murphy 404
Floods and flood warnings, H. C. Frankenfield 404
Preliminary list of deep borings. Part II, Nebraska and Wyoming, N. H. Darton 404
American farm implements, P. McConnell 404
The American plow for the Russian trade 405
Hay or straw baling presses, A. J. Perkins 405
Horsepower as indicating work of steam and oil engines, W. R. Jamieson 405
The modern harvest field 405
On injection motors, L. Lecornu 405

Page.
Third Annual Good Roads Convention, held at Albany, N. Y., Jan. 28–29, 1902. 405
Pennsylvania's road system, J. Hamilton 405
City roads and pavements suited to cities of moderate size, W. P. Judson 405
New covering for roads 405
Road making from the engineer's standpoint, A. W. Campbell 405
Road building with convict labor in the Southern States, J. A. Holmes 405
Government cooperation in object-lesson road work, M. Dodge 405
Mountain roads as a source of revenue, J. W. Abbott 406
The new farm buildings, F. B. Linfield 406
The pressure of stored grain on the sides of receptacles, D. N. Golovin 406
Refrigerating machinery; its principles and management, A. R. Leask 406
Refrigerating and ice-making machinery, A. J. Wallis-Tayler 406
Refrigeration, cold storage, and ice making, A. J. Wallis-Tayler 406
Materials of construction, J. B. Johnson 406

MISCELLANEOUS.

Bulletins and annual reports of Arizona Station, H. J. Hall 406
General index to reports and bulletins of Ohio Station 406
Agriculture in the tropical islands of the United States, O. F. Cook 407
Agricultural investigations in island possessions of the U. S., W. H. Evans 407
The future demand for American cotton, J. L. Watkins 407
The cotton-seed industry, C. M. Daugherty 407
Wheat ports of the Pacific coast, E. S. Holmes 407
Some problems in the rural common school, A. C. True 407
List of Department publications, 1840 to 1901, R. B. Handy and M. A. Cannon 408
Nature study and life, C. F. Hodge 408

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Arizona Station: Page.
- Bul. 43, July 28, 1902 403
- Index to Vol. I, Buls. 1–25, and An. Rpts. 1890–1897, May 1, 1902 406
- Index to Vol. II, Buls. 26–32, and An. Rpts. 1898–99 406

Connecticut State Station:
- Bul. 139, July, 1902 371
- An. Rpt., 1901, pt. 4 ..... 326, 351, 354, 361, 364, 380, 390

Delaware Station:
- Bul. 56, June 20, 1902 372
- Bul. 57, June, 1902 364

Illinois Station:
- Bul. 73, June, 1902 381
- Bul. 74, June, 1902 388
- Bul. 75, July, 1902 388
- Circ. 38, Jan., 1902 382
- Circ. 39, Feb., 1902 374
- Circ. 40, Feb., 1902 356
- Circ. 41, Feb., 1902 356
- Circ. 42, Feb., 1902 356
- Circ. 43, Feb., 1902 367
- Circ. 44, Feb., 1902 356
- Circ. 45, Feb., 1902 354
- Circ. 46, Feb., 1902 360
- Circ. 47, Feb., 1902 360
- Circ. 48, Feb., 1902 382
- Circ. 49, Mar., 1902 364
- Circ. 50, Mar., 1902 386
- Circ. 51, Apr., 1902 388
- Circ. 52, Apr., 1902 351
- Circ. 53, May, 1902 372
- Circ. 54, May, 1902 367
- Circ. 55, May, 1902 367
- Circ. 56, June, 1902 348
- Circ. 57, June, 1902 348
- Circ. 58, July, 1902 367
- Circ. 59, July, 1902 335

Kansas Station:
- Bul. 110, May, 1902 357

Maine Station:
- Bul. 83, June, 1902 373
- Bul. 84, July, 1902 376

Michigan Station:
- Bul. 201, June, 1902 388
- Bul. 202, June, 1902 343
- Special Bul. 15, Mar., 1902 374
- Special Bul. 16, June, 1902 387

Mississippi Station:
- Bul. 73, July, 1902 397
- Bul. 74, Nov., 1901 375
- Bul. 75, Jan., 1902 356

Missouri Station:
- Bul. 53, Nov., 1901 383
- Circ. of Information 12, Apr., 1902 382

Stations in the United States—Continued.

New Hampshire Station: Page.
- Bul. 91, May, 1902 368

New Jersey Stations:
- Bul. 159, June 13, 1902 372
- Bul. 160, June 25, 1902 380

New Mexico Station:
- Bul. 41, Mar., 1902 371

New York Cornell Station:
- Bul. 203, July, 1902 387

North Dakota Station:
- Bul. 52, June, 1902 346

Ohio Station:
- Bul. 128, Index Sup 406

Oklahoma Station:
- Eleventh An. Rpt., 1902 406

Oregon Station:
- Fourteenth An. Rpt., 1902 ..... 328, 332, 348, 352, 367, 368, 370, 406

Utah Station:
- Bul. 77, June, 1902 383
- Twelfth An. Rpt., 1901 ..... 406, 407

Wyoming Station:
- Bul. 50, Mar., 1902 359
- Bul. 51, May, 1902 382
- Bul. 52, Apr., 1902 339
- Bul. 53, June 1902 404
- Twelfth An. Rpt., 1902 ..... 339, 347, 350, 385, 386, 398, 402, 407

U. S. Department of Agriculture.

- Farmers' Bul. 156 358
- Farmers' Bul. 157 353
- Farmers' Bul. 158 404
- Rpt. 72 ..... 350, 351, 366
- Yearbook, 1901 ..... 328, 336, 337, 338, 342, 344, 346, 349, 350, 356, 360, 361, 363, 371, 374, 379, 383, 396, 403, 404, 405, 406, 407

Division of Biological Survey:
- Circ. 36 338
- Circ. 37 338
- Circ. 38 338
- North American Fauna No. 22, Oct. 31, 1902 336

Division of Entomology:
- Circ. 46 (second series) 375
- Circ. 47 (second series) 374
- Circ. 48 (second series) 374
- Circ. 49 (second series) 374
- Circ. 50 (second series) 374
- Circ. 51 (second series) 374

Division of Publications:
- Bul. 6 408

Division of Statistics:
- Crop Reporter, vol. 4, Nos. 4–6, Aug.–Oct., 1902 407

Public Road Inquiries:
- Bul. 22 405

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The Editor and H. W. Lawson.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. Beal.
Botany and Diseases of Plants—Walter H. Evans, Ph. D.
Foods and Animal Production—C. F. Langworthy, Ph. D.
Field Crops—J. I. Schulte.
Entomology and Veterinary Science—E. V. Wilcox, Ph. D.
Horticulture—C. B. Smith.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 5.

	Page.
Editorial notes:	
Overworking among experiment station men	413
Need of extending the scope of station operations	415
Recent work in agricultural science	417
Notes	510

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

Determination of sulphur and phosphorus in plant substances, C. P. Beistle	417
Determination of sulphur and phosphorus in organic materials, H. C. Sherman	417
Estimation of soil acidity and the lime requirements of soils, F. P. Veitch	418
Tacke's method for determining acidity in soils, M. Gratchev	418
A short method of determining potash, B. Sjollema	418
Volumetric determination of lime, N. Stepanov	418
Separation of iron, aluminum, and phosphoric acid from lime, N. Stepanov	418
Separation of soil particles in mechanical analysis, G. Nefedof	419
On the combustion of nitrogen, R. Salvadori	419
The artificial production of nitrates, Maizières	419
Determination of lactose in milk, Degrez	419
A method for the quantitative estimation of ergot in flour, W. Mitlacher	419
Cause of injury of platinum crucibles in analysis of phosphates, W. C. Heraeus	419
Laboratory work, P. Bonâme	419
Directions for laboratory work in physiological chemistry, H. C. Jackson	419
Eighteenth annual convention of Association of Official Agricultural Chemists	419

BOTANY.

Report of the consulting botanist, W. Carruthers	419
Report of the section of botany, A. Löfgren	420
Report of the government botanist, J. H. Maiden	420
Flora of the Galapagos Islands, B. L. Robinson	420

Page.
The phylogeny of the cotyledon, H. L. Lyon 420
Some neglected factors in discussions of heredity, G. J. Peirce 420
Soil temperatures and vegetation, D. T. MacDougal 420
On the distribution of acids in stems, leaves, and flowers, A. Astruc 420
A simple method for demonstrating the translocation of starch, S. M. Bain ... 421
Testing for mannose, F. H. Storer 421
The effect of acetylene gaslight on plant growth, F. W. Rane 421
The specific individuality of root-tubercle bacteria, H. Buhlert 421
The fixation of nitrogen by leguminous plants, T. Remy 421
Nitrogen assimilation and proteid formation of plants, T. Czapek 422
Germinative power of the conidia of *Aspergillus oryzæ*, Mary F. Hiller 422
Stimulating action of soluble salts of copper on *Penicillium glaucum*, Le Renard. 422
The resistance of some molds to metallic poisons, C. Pulst 422
Preliminary notes on some new species of fungi, G. F. Atkinson 422
The physiology of sea water, R. H. True 423
Publications relating to botany in library of U. S. Department of Agriculture. 423

WATER—SOILS.

A new process for purifying potable water, P. Guichard 423
Determination of the reducing capacity of natural waters, L. W. Winkler 423
The river-irrigating waters of Arizona, R. H. Forbes 423
A soil study. IV, The ground water, W. P. Headden 424
Alkali, J. D. Tinsley 426
Drainage and flooding for the removal of alkali, J. D. Tinsley 426
The rôle of the plant in dissolving the plant food of the soil, P. Kossovich 427
Influence of calcium carbonate on the progress of decomposition of organic matter, P. Kossovich and I. Tretjakov 427
The changes in soils which render them productive, A. Krainsky 427
Denitrification in cultivated soil, G. Ampola and C. Ulpiani 427
Experiments on denitrifying organisms of manure, straw, etc., C. Höflich 428
On denitrification, H. Weissenberg 428
Soil bacteria and the nitrogen question, A. Koch 428
The presence of lime as dolomite in certain cultivated soils, T. L. Phipson 428
Glacial formations and drainage features of Erie and Ohio basins, F. Leverett. 428
The geology of Louisiana, G. D. Harris, A. C. Veatch, and J. A. A. Pacheco ... 428
Science in agriculture 428

FERTILIZERS.

The value of barnyard manure, C. E. Thorne and J. F. Hickman 428
Aerobic fermentation of barnyard manure, C. Dupont 429
Experiments on the treatment of barnyard manure with lime, O. Reitmair ... 429
Experiments with a fertilizer made from beet-sugar factory refuse, H. Svoboda. 429
Chemical-agricultural investigations on "ligara," F. Gabbrielli 429
The green manuring of heavy soils, F. Hanusch 429
Clover as a fertilizer, W. Saunders 430
A study of the cultural value of fertilizers, E. Rabaté 430
The solvent power of different plants for mineral phosphates 430
The phosphate rocks of Arkansas, J. C. Branner and J. F. Newsom 430
Formation of oceanic salt deposits. XXVII, The artificial preparation of Pinnoit, J. H. van't Hoff and G. Bruni 430
Fertilizer experiments on moor soils in Sweden 430
The after-effect of commercial fertilizers, Bachmann 430
Analyses of commercial fertilizers, H. J. Wheeler et al 431

FIELD CROPS.

Silage studies, F. W. Morse 431
Culture experiments in 1900–1901, A. Damseaux 431
Influence of size of seed grains on yield of grain and straw, F. Lubanski 432
Results on the experimental fields of Haute Marne 432
Report of the Agricultural Chemical Experiment Station at Vienna in 1901 ... 432
Report of the Moor Culture Station at Karlshuld, T. Mayer 432
Economic notes on some of the grasses in southwest Missouri, S. A. Hoover .. 432
Forage conditions of central Montana, F. A. Spragg 432
The summer ranges of western Nevada sheep, P. B. Kennedy and S. B. Doten. 432

Page.
Grasses and legumes, C. S. Phelps 432
Forage and pasture plants of Iceland, S. Stefánsson and H. G. Söderbaum 432
Cooperative fertilizer tests with grasses and field crops 432
Grass mixtures for hay and pasture 433
Some Australian vegetable fibers, J. H. Maiden 433
Alfalfa, R. L. Bennett 433
Alfalfa for Maryland, W. T. L. Taliaferro 433
Alfalfa, Trabut 433
Experiments with barley in 1902, L. Grandeau 433
Tests with malting barley 433
Buckwheat culture at high altitudes, H. P. Weber 433
Carrots as a forage crop, F. Lubanski 433
Red and striped maize, H. Stewart 433
Cotton culture in Senegal, Ponty 433
Cotton culture in Asia Minor, Y. Henry 433
The cultivation of flax on the Dugin estate 433
Experiments with lupines, vetches, and peas for green manuring, O. Pitsch 433
Increasing the yield of mangels, A. Arnstadt 434
Marram grass 434
Marram grass, A. Molineaux 434
Experiments with oats in 1902, L. Grandeau 434
Experiments with different phosphates for oats, H. G. Söderbaum 434
Influence of different temperatures on the growth of roots, A. Tolsky 434
Methods of plant breeding, A. Kirsche 434
Relation of composition and anatomical character to value of potato tubers, F. Waterstradt and M. Willner 434
Electro-culture of crops 435
Experiments in storing potatoes, O. Appel 435
Report on ramie, E. Dazey 435
Rice cleaning and polishing, D. C. Roper 435
Rational fertilization of soil seeded to winter rye, S. Bogdanov 435
Notes on sugar-beet culture 435
Sugar cane report, season 1901, H. J. Blyth 435
Sweet potato experiments, C. L. Newman 435
Fertilizers for tobacco, B. W. Kilgore 436
Manufactures of tobacco, J. H. Garber 436
Vicia augustifolia allioni, L. Wittmack 436
The assimilation of plant food by wheat, J. Adorján 436
Report of the wheat experimentalist, W. Farrer 437

HORTICULTURE.

Cantaloupe culture in Georgia, S. H. Fulton 437
The effects of colored light, L. C. Corbett 437
A new edible tuber, *Coleus coppini*, E. Heckel 437
Water cress in Erfurt, R. Engelhardt 438
Experiments in mulching vegetables, R. A. Emerson 438
The value of chemical manures, F. W. H. Shrivell 438
Report on experiments in fruit and vegetable drying, 1901, J. Udale 438
The effect of hydrocyanic-acid gas on fresh fruit, H. Schmidt 438
Fruit growing in New England and its development, A. Low 438
Experiments in orchard culture, C. G. Marshall 438
Orchard cover crops 439
Stringfellow method of planting 439
Locating orchards in Washington, S. W. Fletcher 439
Planting orchards in Washington, S. W. Fletcher 439
Nursery stock for Washington orchards, S. W. Fletcher 439
The commercial apple area, W. A. Taylor 439
Apple growing, pollination, and time of bloom, Maskew 440
Comparing keeping qualities of apples, S. A. Beach 440
Apple and pear hybrid 440
Varieties of apples and peaches, J. T. Stinson 440
The Peen-to peach group, H. H. Hume 440
Orchard results from the sugar prune, C. W. Reed 440
Olives, G. E. Colby and F. T. Bioletti 441
The olive; its culture, oil, and adulteration, L. Cabrié 441
Cultivation, enemies, and commerce of citrus fruits, G. del Viscio 441

Page.
Trees on sour and *Citrus trifoliata* stocks, G. L. Taber 441
The trifoliata down South 441
Hybrid oranges in Texas, G. Marti 442
Notes on lemon curing, D. Jones 442
The banana industry in Jamaica, W. Fawcett 442
Cultivation of Japanese kaki, figs, almonds, etc., in the Crimea, V. Aggeenko. 442
Tea, C. A. Guigon 443
The quantity of caffein in several species of coffee trees, G. Bertrand 443
Cacao, culture and preparation, P. Preuss 443
The composition of Norwegian small fruits, A. Ystgaard 443
New ideas in strawberry growing, R. M. Kellogg 444
The sand cherry in cultivation, R. A. Emerson 444
Grafting green grapevines, J. Zawodny 444
Hybridization at Beblenheim, C. Oberlin 444
Hybrid direct producers in calcareous soils, J. M. Guillon 444
Value of hybrids for wine, J. R. Chevrier 445
The affinity of *Vitis vinifera* with *V. berlandieri*, T. V. Munson 445
Effect of phosphoric acid on quality of wines and on gray rot, E. Marre 445
Contribution to the preparation of orchard fruit wines, E. Hotter 445
Pecans, F. H. Burnette, W. C. Stubbs, and H. A. Morgan 445
The shrubs of Wyoming, E. E. Nelson 445
Bulb culture in North Carolina, W. F. Massey 445
Bulbs in Washington, L. C. Corbett 446
An experiment with hyacinths in water, E. E. Bogue 446
How to make money growing violets, G. Saltford 446
Gilliflower and wallflower culture in Erfurt, R. Engelhardt 446
Hybridizing Gladiolus species, W. Van Fleet 446
A classification of sweet peas, H. J. Wright 446
Mendel's laws of alternative inheritance in peas, W. F. R. Weldon 446
Mendel's law applied to orchid hybrids, C. C. Hurst 447
Culture of orchids in leaf mold, L. P. De Langhe-Vernaene 447
A graft hybrid of Crataegus-Mespilus, J. Jensen 447
Fundamental principles of plant breeding, L. Burbank 447
Pictorial greenhouse management, W. P. Wright 447
A garden in the suburbs, Mrs. Leslie Williams 447
European and Japanese gardens 447
School gardens at School of Horticulture, Hartford, Conn., H. D. Hemenway. 448
School gardens, their development and functions, D. J. Crosby 448
The preparation of essential oils in the West Indies, J. H. Hart 448
Practical treatise on the culture of tropical plants, J. Dybowski 448
A quarter century's evolution in American horticulture, P. O'Mara 448
Gardencraft, old and new, J. D. Sedding 448

FORESTRY.

Report on the Southern Appalachian Mountain region, James Wilson 448
New forest reserves 449
The Michigan Forest Reserve, T. H. Sherrard 449
The management of Michigan hard-wood forests, W. C. Winchester 449
The jack pine plains of Michigan, F. Roth 449
The protection of the New Hampshire forests 449
Forestry work on the South Mountain Reservation, G. H. Wirt 449
Action of the Pennsylvania State Forestry Reservation Commission 450
Forestry on the Girard estate in 1901 450
Study of a chestnut wood lot, A. S. Haines 450
Forestry in Ireland, W. Dick 450
The natural restoration of the forests of Switzerland, Engler 450
The reforestation of loose and worn soils, Matthes 451
Coppice in the Ardennes, C. Delville 451
An excursion in the Campine region, E. Nélis 451
Preservation of natural characters of forests, etc., C. Bommer 451
The characteristics of various species of forest trees as nursery trees 451
Report of expert forester on the Hawaiian forests, E. M. Griffith 451
The timber resources of the Australian Commonwealth, E. T. Scammell 451
The renewal of the forests in Cochin China, C. L. Roy 452
Report of the forester, and the woods of Tonkin, Brenier 452
Forest trees for calcareous soils, P. Mouillefert 452

Page.
Profitable tree planting, J. G. Kelly 452
Trees for shelter 452
Street tree planting 452
Shade trees, W. A. Murrill 452
The alders, J. Houba 453
The relationship of some American and Old World birches, M. L. Fernald ... 453
The slippery elm, J. T. Rothrock 453
Treatment of second-growth white pine, W. I. Hutchinson 453
The Jersey scrub pine, J. T. Rothrock 453
Notes on the Noble fir (*Abies nobilis*), J. G. Peters 453
The treatment of spruce in artificial plantations, C. Broilliard 453
Note on the fuel value of cottonwood, C. E. Bessey 453
Some recent advances in the fireproofing treatment of wood, S. P. Sadtler 453
Wastefulness in turpentine industry, C. Herty 454
A first book of forestry, F. Roth 454

DISEASES OF PLANTS.

Notes on some West American fungi, D. Griffiths 454
Concerning some fungi occurring on tropical economic plants, A. Zimmermann. 454
Cultures of Uredineæ in 1900 and 1901, J. C. Arthur 455
New species of Uredineæ, J. C. Arthur 455
A new species of Rhytisma, W. A. Kellerman 455
New Alabama fungi, J. B. Ellis and B. M. Everhart 455
Experimental production of plant parasites among common bacteria, L. Lepoutre 455
Pure cultures of *Puccinia dispersa*, H. M. Ward 455
The parasitism of *Botrytis cinerea*, R. E. Smith 456
"Take-all" in wheat, D. McAlpine 456
The presence of nematodes and stinking smut in wheat, R. Maire 456
A new disease of winter barley, L. Hecke 456
Tilletia horrida on rice in South Carolina, A. P. Anderson 456
Sclerospora macrospora, a parasite of maize, G. Cugini and G. B. Traverso 457
Experiments in combating millet smut, L. Hecke 457
Clover sickness, V. Anzimirov 457
A rust spotting of potatoes, F. Bubak 457
Tomato blights, N. A. Cobb 457
Bacteriosis of tomatoes, D. McAlpine 458
The bacteriosis of kohl-rabi, L. Hecke 458
Diseases of plants and their remedies, D. McAlpine 458
Canker and gummosis of fruit trees, F. T. Brzezinski 458
Cure for canker on apple trees, G. D. Huet 459
A new form of *Fusicladium dendriticum*, G. Scalia 459
Black rot of oranges, N. B. Pierce 459
Disease of Maryborough oranges, H. Tryon 459
On the development of the anthracnose of bananas, G. Delacroix 459
A nematode disease of coffee, G. Delacroix 459
Some nematode diseases of plants, G. Delacroix 460
Occurrence of *Coronartium ribicola* in the Dahlen botanic gardens, P. Hennings. 460
Diseases of forced strawberry plants, J. Curé 460
Some diseases and parasites of vanilla, A. Zimmermann 460
Two diseases of vanilla, G. Delacroix 460
Grape diseases and their treatment, F. Gvozdenovic 460
Suggestions for combating grape mildew, J. M. Guillon 460
Brunissure and the California vine disease, E. H. Twight 460
Court-noué of grapes in Yonne, G. Chappaz 461
An epidemic of brown rot in the vicinity of Paris, M. Molliard 461
Downy mildew of grapes, Trabut 461
The treatment of powdery mildew, J. Dufour 461
Rose rust, D. McAlpine 461
Septoria disease of carnations, P. Voglino 461
Schizophyllum commune, a parasite of the horse chestnut, F. Gueguen 461
Some new parasitic fungi of oaks, E. Henry 462
Canker of *Abies balsamea* in Minnesota, A. P. Anderson 462
The preparation of fungicides, L. Degrully 462
Purity and control of copper sulphate, E. Chuard 462

ENTOMOLOGY.

Page.
Notes on economic entomology, F. V. Theobald 462
Seventeenth report of the New York State entomologist, E. P. Felt 463
Report of the government entomologist for the year 1901, C. P. Lounsbury ... 464
Second report of the government entomologist, 1901, C. Fuller 465
Experiments with insecticides on some garden and greenhouse pests, R. Newstead 465
Insect enemies of the pear, plum, peach, and cherry, C. P. Gillette 466
Remedies for insect and fungoid pests of the orchard and farm, A. M. Lea ... 466
Injurious and useful insects, L. C. Miall 467
The enemies of agriculture, A. L. Herrera 467
Caterpillars and their moths, Ida M. Eliot and Caroline G. Soule 467
Enemies of wheat, G. F. de Champville 467
The diamond-back moth, G. H. Carpenter 467
Report on codling-moth investigations in the Northwest, 1901, C. B. Simpson. 468
The codling moth, J. H. Crowley 468
Successful treatment for codling moth, W. S. Coburn 468
The California peach-tree borer, C. W. Woodworth 468
Two peach scales, H. A. Gossard 469
Spraying for San José scale with kerosene and crude petroleum, F. A. Sirrine .. 470
Experiments for the destruction of San José scale, W. J. Allen 471
New method of destroying *Tortrix pilleriana*, etc., P. Vermorel and Gastine .. 471
An account of the black currant bud gall mite, E. J. Lewis 471
Grasshoppers in California, C. W. Woodworth 471
Departmental notes on insects that affect forestry, No. 1, E. P. Stebbing 472
Insect enemies of shade trees, E. P. Felt 472
Galls and insects producing them, I, II, M. T. Cook 472
The chemical composition of insecticides and fungicides, J. K. Haywood 472
Remedies and formulas for extermination of pests injurious to tree and plant life 474
Index to Bulletins 1–30 (new series) of the Division of Entomology, N. Banks. 474
Twenty-second annual convention of the Colorado State Beekeepers' Association 474
Studies on the silkworm during the pupal condition, R. Dubois and E. Couvreur. 474

FOODS—NUTRITION.

Dietary studies in New York City in 1896 and 1897, W. O. Atwater and A. P. Bryant 474
Practical dietetics, W. G. Thompson 475
The complete Indian housekeeper and cook, Flora A. Steel and Grace Gardiner. 475
Origin and preparation of the most important foods and condiments, E. Seel .. 475
Composition of beef from different regions of France and the colonies, Busson. 475
Tenderness of meat and its relation to thickness of muscle fibers, L. Isaak 476
Study of a new proteid preparation, "Proton," E. O. Hultgren 476
Studies with the Egyptian fermented milk called leben, E. Rist and J. Khoury. 476
Buttermilk as an infant food, A. Baginsky 476
Manufacture of semolina and macaroni, R. P. Skinner 476
Concerning the water content of bread, Walter 476
Concerning a new bread rich in cellulose, R. Barany 476
Chemical and sanitary studies of bread sold in Jurjew, J. F. Masing 476
Sandy bread, H. Kreis 476
The acidity of bread, its cause, and methods of estimating it, K. B. Lehmann .. 476
The difference in composition of low and high milling products, L. Lindet ... 477
Some methods of estimating the value of flour, P. G. Ivanov 477
Banana flour 477
Yams (*Ipomœa batatas*), L. Bonnin 477
Regulations governing sale of edible fungi in Munich markets, K. Giesenhagen. 477
Estimating the value of fig coffee, O. von Czadek 477
Effect of tea and coffee upon respiration, K. B. Lehmann and G. Rohrer 477
Effect of muscular work upon the digestibility and metabolism, C. E. Wait ... 477
The physiological effects of route marching, N. Zuntz and Schumburg 477
The digestibility of foods with special reference to hygiene, C. Fermi 478
The nutritive value of meat extract, J. Frentzel and N. Toriyama 478
The effect of sunlight upon the gaseous exchange in man, H. Wolpert 478
The harmfulness of boric acid as a food preservative, J. Kister 478
Review of the literature of foods for the year 1900, A. J. J. Vandevelde 478
Review of articles on foods published in 1901, A. J. J. Vandevelde 478

ANIMAL PRODUCTION.

	Page.
Feeding value of different forage plants, R. Dumont	479
Feeding animals; brewers' grains and malt, F. Weber	479
The utilization of the by-products of malting and brewing, A. Van Roost	479
Cakes from oil-bearing seeds, L. Bussard and G. Fron	479
Sugar and muscular energy, L. Grandeau	479
Molasses in mixed feeds, H. Van de Venne	479
The feeding value of beet pulp, B. C. Buffum and C. J. Griffith	479
The feeding of farm animals, H. J. Patterson	479
Animal breeding, T. Shaw	479
Session of Improved Live Stock Breeders' Association	479
The rearing of calves on milk substitutes, H. Hayward	479
Baby beef, H. M. Cottrell	480
Results of a cattle feeding test, W. J. Kennedy and F. R. Marshall	481
Quality in beef, H. M. Cottrell and V. M. Shoesmith	482
Fattening steers without hogs to follow, H. M. Cottrell and J. G. Haney	482
Beef cattle, W. L. Hutchinson and E. R. Lloyd	483
Fattening steers with different quantities of grain, R. S. Shaw	484
Bullock feeding experiment	485
Cattle raising, H. Werner	485
Polled cattle	485
Study of the races, varieties, and crosses of French cattle, de Lapparent	485
Comparative results from feeding lambs, wethers, and ewes, R. S. Shaw	485
The results of a swine feeding experiment, W. J. Kennedy and F. R. Marshall	485
Pork production experiments and hog ranching, R. L. Bennett	486
Experiments with sugar as a feeding stuff, Alekan	486
The history of horseshoeing, E. Aureggio	486
Cooperative experiments on the cost of egg production, H. H. Wing	486
Two hundred eggs a year per hen; how to get them, E. L. Warren	487
The iron content of hens' eggs, C. Hartung	487
The production of oxygen in hens' eggs, K. A. Hasselbalch	487

DAIRY FARMING—DAIRYING.

Some feeding experiments with cows, H. J. Patterson	487
Experiments on the feeding of dairy cows, L. Grandeau	488
Feeding beet pulp and sugar beets to cows, B. C. Buffum and C. J. Griffith	488
Demonstration experiments on the feeding of dairy cows in Belgium	488
Influence of kola feeding stuff upon milch cows, O. Hagemann et al	488
Milking sheds, R. Crowe	488
Micro-organisms in air of stables, in milk, and in the mammary gland, C. Barthel	488
A new micrococcus isolated from straw, causing ropy milk, J. Hohl	489
Creaming of milk during its sale, W. Frear and M. H. Pingree	489
The ripening of cream, M. Henseval	489
Chemical analyses and physical constants of milk, M. G. Quesneville	489
The specific gravity and water content of milk serum, J. Nisius	489
Action of lactic acid on copper, with reference to manufacture of sour milk cheese, M. Siegfeld	489
Heating of milk with special reference to dairies, A. Tjaden et al	489
Bitter milk and cheese, F. C. Harrison	489
Curing of Cheddar cheese with especial reference to cold curing, S. M. Babcock and H. L. Russell	490

VETERINARY SCIENCE AND PRACTICE.

The practice of veterinary surgery. I, Operative technique, J. A. W. Dollar	491
Operative veterinary surgery, G. Fleming	491
Animal castration, A. Liautard	491
American horse, cattle, and sheep doctor, R. McClure	491
The veterinary compendium, W. E. Van Ame	491
A manual of bacteriology, clinical and applied, R. T. Hewlett	491
Cellular toxins, V. C. Vaughan and F. G. Novy	492
Protargol in veterinary surgery, W. E. A. Wyman	492
Lysol in agriculture	492
Intravenous injections of corrosive sublimate in the treatment of infectious diseases, A. Degive	492
The disinfection of stalls and railroad stock cars, Röder	492

Page.
Laws relating to contagious and infectious diseases of animals, 1901 492
Report on the veterinary service in the Kingdom of Saxony for the year 1901. 493
Annual reports of proceedings under the diseases of animals acts, etc., 1901, A. C. Cope and J. T. Tennant 493
Human and bovine tuberculosis, R. Koch and J. W. Schütz 493
Comparative virulence for animals of tubercle bacilli of bovine and human origin, A. De Jong 494
The relation between human and bovine tuberculosis, A. D. Blackader 494
Feeding and inoculating calves with human tuberculous material, W. H. Park. 494
Further experiments on immunizing cattle to tuberculosis, J. McFadyean 495
Wheezing as result of retropharyngeal tuberculous adenitis, C. Besnoit 495
New plan for controlling tuberculosis of cattle conservatively, "Columella" .. 495
The X-ray as an aid to diagnosis of tuberculosis in cattle, J. V. Laddey 495
Culture and biology of the tubercle bacillus, H. Menzi 496
Action of urea and ammonium carbonate on tubercle bacillus, Rappin 496
Resisting power of buffaloes against experimental tuberculosis, M. Prettner.. 496
Effect of tubercle bacilli introduced in the trachea, etc., K. Watanabe 496
Histogenesis of hematogenous tuberculosis in the liver of rabbits, J. Miller... 497
Hematological studies on experimental tuberculosis, H. Claude and A. Zaky. 497
Influence of meat diet on inoculation of tuberculosis in chickens, K. Preisich. 497
Contamination of meat of healthy animals with tubercle bacilli, G. Decker... 497
Preliminary report on the use of blackleg vaccine in Virginia, E. P. Niles.... 498
Irrigation of the organism in experimental infection of tetanus, C. Tonzig.... 498
Traumatic tetanus in horses, C. Eggmann 498
The production of toxoids in cultures of tetanus bacilli, A. Bonome 498
Intracerebral injection of antitetanin for tetanus in the horse, S. Villar..... 498
Investigations on the nature of tetanus toxin, H. Hayashi 498
Actinobacillosis, J. Lignières and J. Spitz 498
Actinomycosis, J. Barcia y Trelles 499
Observations on vertebral actinomycosis in cows, Poes 499
The unsolved problems of milk fever, J. M. W. Kitchen 500
An enzoötic attack of chorea among cattle, A. D. Knowles 500
Poisoning by feeding on *Sinapsis nigra*, F. J. Roub 500
Foot-and-mouth disease; account of outbreak in Suffolk in 1901, E. J. Cheney. 500
Ineffectiveness of Baccelli's method for foot-and-mouth disease, M. Strebel... 500
Corrosive sublimate, the newest remedy for foot-and-mouth disease, M. Strebel 500
Pustulous dermatitis of cattle, E. Liénaux 500
Contagious pustular dermatitis of sheep, A. H. Berry 501
The lesions in sheep pox, F. J. Bosc 501
True epithelioma in the liver in cases of sheep pox, F. J. Bosc 501
Sheep scab, J. Spencer 501
The stomach worm, J. Spencer 501
Heart water in sheep and goats, D. Hutcheon 501
Lungworm disease among members of the deer family in Bohemia, G. Zaufal. 501
A few diseases of the hog, A. T. Peters 502
Swine fever, A. H. Berry 502
A preliminary report on glanders, S. B. Nelson 502
Glanders in South Africa, R. C. Cochrane 503
Clinical notes on African horse sickness, J. T. Coley 503
The veterinary inspection of imported American horses, P. T. Howard 503
Ship pneumonia, E. E. Martin 503
Combating pneumonia by serum treatment, Mieckley 503
Nodular peribronchitis of the horse, of a verminous origin, E. Liénaux 503
Mange in horses, J. Spencer 503
Malignant mold fungus disease of horses, J. de Haan 504
Wandering bot-fly larvæ, C. Leknæs 504
Tibio-peroneal neurectomy for the relief of spavin lameness, W. E. A. Wyman. 504
Diagnosis of anthrax, O. Hosang 504
The pyocyanase of Emmerich and Leow in experimental anthrax, L. Tavernari. 504
Some observations on the *Bacillus anthracoides*, F. A. Bainbridge 504
Anthrax in dogs, Lüpke 505
Rabies, D. E. Baughman 505
Antitoxin in distemper, H. A. Stevenson 505
Malignant jaundice in the dog, W. Robertson 505
Intravenous injections of corrosive sublimate, A. Serafini 505
Causes which determine the absence of phagocytosis in the last stages of fowl cholera in rabbits, B. Werigo 505

Page.
Bacillar septicemia in chickens, F. Fuhrmann 506
Goose septicemia, C. Curtice 506
Diphtheria of birds, C. Guérin 506
Infestation of ducks with *Dermanyssus avium*, R. Klee 507

AGRICULTURAL ENGINEERING.

Irrigation of rice in the United States, F. Bond and G. H. Keeney 507
The control of water from melted snow by means of terraces, P. Jankovski ... 507
List of references to publications relating to irrigation and land drainage, Ellen A. Hedrick 507
Tests of agricultural machines at Plessis, E. Leplae 507
Agricultural implements and machines at exposition of Hasselt in 1900, J. Pyro 507
Notes on the application of cold to agricultural products in commerce 507

MISCELLANEOUS.

Proceedings of the fifteenth annual convention of the Association of American Agricultural Colleges and Experiment Stations, A. C. True et al 508
Statistics of land-grant colleges and agricultural experiment stations, 1901 508
Agricultural experiment stations and experimental fields, L. Grandeau 508
Demonstration fields—their organization, object, and uses, L. Grandeau 508
History of Ohio agriculture, C. W. Burkett 508
Report on Hungarian agriculture, C. Baudoüin 508
Sources of agricultural imports of United States, 1897–1901, F. H. Hitchcock .. 508
Distribution of agricultural exports of the United States, 1897–1901, F. H. Hitchcock 508
Agricultural returns for Great Britain for 1901 509
Crop statistics for the Northwest Territories in 1901 509
By-products of the starch industry in the United States 509
The utilization of wastes and by-products, H. G. Kittredge 509
Notes on miscellaneous work, P. Bonâme 509
Index to yearbooks of the U. S. Department of Agriculture, C. H. Greathouse. 509

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

	Page.
Arizona Station:	
Bul. 44, Sept. 30, 1902	423
Arkansas Station:	
Bul. 72, 1902	435
Bul. 73, 1902	486
Bul. 74, 1902	430
Bul. 75, 1902	433
California Station:	
Buls. 123 and 137 (revised), 1902	441
Bul. 142, Aug., 1902	471
Bul. 143, Sept., 1902	468
Colorado Station:	
Bul. 72, Aug., 1902	424
Bul. 73, Aug., 1902	479, 488
Florida Station:	
Bul. 61, July, 1902	469
Bul. 62, July, 1902	440
Georgia Station:	
Bul. 57, Aug., 1902	437
Iowa Station:	
Bul. 65, Aug., 1902	485
Bul. 66, Aug., 1902	481
Kansas Station:

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The Editor and H. W. Lawson.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. Beal.
Botany and Diseases of Plants—Walter H. Evans, Ph. D.
Foods and Animal Production—C. F. Langworthy, Ph. D.
Field Crops—J. I. Schulte.
Entomology and Veterinary Science—E. V. Wilcox, Ph. D.
Horticulture—C. B. Smith.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 6.

Page.

Editorial notes:
Some factors in research work 517
P. P. Dehérain, deceased 519
Agricultural Science at the American Association meeting 520
Recent work in agricultural science 544
Notes 617

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

Association of Agricultural Experiment Stations in the German Empire 544
The action of distilled water upon lead, F. Clowes 544
The determination of iron in natural waters, L. W. Winkler 545
Determination of nitric acid in water by Noll's method, W. P. Kaschkadamov. 545
The volumetric determination of nitric acid in drinking waters, O. Schmatolla. 545
The litmus-paper test for milk, H. D. Richmond 545
Estimation of proteolytic compounds in cheese and milk, L. L. Van Slyke and E. B. Hart 545
Concerning the coagulable material in egg white, L. Langstein 545
Concerning the character of free fatty acids, E. A. Lösch 545
The estimation of starch in cereal grains, L. Lindet 545
Filtration in determination of crude fiber, R. W. Thatcher 545
The analysis of vanilla extract, A. L. Winton and M. Silverman 545
Methods for the examination and valuation of foods, etc., in German Empire. 545
The chemistry of india rubber, C. O. Weber 546
Analysis of resins, balsams, and gum resins, K. Dieterich, trans. by C. Salter. 546
Quantitative determination of organic compounds, W. Vaubel 546

BOTANY.

Influence of varying amounts of carbon dioxid on photosynthesis, H. T. Brown and F. Escombe 546
Influence of an excess of carbon dioxid in the air on the form and internal structure of plants, J. B. Farmer and S. E. Chandler 547

Page.

Investigations in chlorophyll assimilation of leaves, E. Griffon 547
The influence of colored light on vegetation, G. T. Grignan 547
The influence of different colored light upon plants, C. Flammarion 547
The influence of electricity upon plants, C. Flammarion 548
Certain relations of plant growth to ionization of the soil, A. B. Plowman 548
Effect of composition of soil on the minute structure of plants, H. B. Dorner . 548
Influence of sulpho-cyanic acid on growth of *Aspergillus niger*, A. Fernbach .. 549
The presence of rennet in plants, M. Javillier 549
Seed selection in Belgium, E. Leclercq 549

ZOOLOGY.

Birds of a Maryland farm. A local study of economic ornithology, S. D. Judd. 549
The birds of Wyoming, W. C. Knight 550
The birds of North and Middle America, II, R. Ridgway 550
Handbook of birds of the Western United States, Florence M. Bailey 551
Birds of the Rockies, L. S. Keyser 551
Adirondack birds and their relation to forestry, E. A. Sterling 551
The commonest birds in Egypt in their relation to agriculture, G. Bonaparte . 551
Insectivorous birds of Victoria, C. French 551
Index animalium, C. D. Sherborn 551

METEOROLOGY—CLIMATOLOGY.

Monthly Weather Review, Vol. XXX, Nos. 4–9 551
Meteorology in Hawaii 552
Statics and kinematics of the atmosphere in the United States, F. H. Bigelow. 553
Report of Station of Agricultural Climatology of Juvisy, 1901, C. Flammarion. 553
Existence of a warmer current of air at an altitude of 10 to 15 km., R. Assmann. 553
On some phenomena which suggest a short period of solar and meteorological changes, N. and W. J. S. Lockyer 553
Weather conditions, C. W. Peterson 553
Rainfall in the agricultural districts of Queensland, C. L. Wragge 553
Meteorology of New Zealand 553
Meteorology, P. Bonâme 553
On the climate of Tunis, G. Ginestous 553
Climatology of Poulo-Condore, G. Le Lay 553
Thunderstorms and hailstorms, K. Prohaska 553

WATER—SOILS.

Water, A. J. J. Vandevelde 554
Six months' daily examination of Melbourne tap water, T. Cherry 554
Sanitary analyses of some Iowa deep-well waters, J. B. Weems 554
Purification of drinking water by ozone, E. Sugg and A. J. J. Vandevelde ... 554
Chemical composition of sewage of Iowa College sewage plant, J. B. Weems et al 554
A consideration of the action of saline irrigation water, C. F. Eckart 554
Water-holding power and irrigation of Hawaiian soils, etc., J. T. Crawley 555
The reversion of superphosphate of lime in the soil, W. F. Sutherst 555
Soil chemistry and bacteriology, J. G. Lipman 556
On the classification of soils, K. O. Bjørlykke 556

FERTILIZERS.

Handbook of fertilizers, M. Passon 556
Phosphates, H. J. Patterson 556
Investigations relative to the use of nitrogenous materials, E. B. Voorhees ... 557
The availability of organic nitrogen in raw materials, J. P. Street 557
Nitrate of soda in Africa, Maizières 557
New deposits of nitrate 558
On injury by perchlorate, B. Sjollema and A. Stutzer 558
Fertilizing Hawaiian rice soils, J. T. Crawley 558
Fertilizing in fall and winter 558
Analyses of commercial fertilizers, M. A. Scovell and H. E. Curtis 558
Analyses of commercial fertilizers, W. L. Hutchinson 558
Fertilizers 558
Analyses of commercial fertilizers, L. L. Van Slyke and W. H. Andrews ... 558

FIELD CROPS.

	Page.
Annual report of Alaska Experiment Stations, 1901, C. C. Georgeson	558
Annual report of Hawaii Agricultural Experiment Station, 1901, J. G. Smith	560
Annual report of Porto Rico Experiment Station, 1901, F. D. Gardner	560
Report of the agriculturist, E. R. Lloyd	561
Report of Calgary Experiment Station, P. T. Bone	561
Annual report on experimental farms and gardens in the Bombay Presidency	561
Methods of conducting plat experiments, B. R. Larsen	561
Crop report for 1901 and 1902, F. G. Sly	561
The effect of potash on plants, H. Wilfarth and G. Wimmer	561
Fertilizer tests on grass, barley, and swedes	563
Experiments with phosphatic fertilizers on meadows and rye, Remy	563
Alfalfa on Illinois soil, C. G. Hopkins	563
Growing alfalfa in Kansas, H. M. Cottrell	564
Fertilizer and culture experiments with hops, A. D. Hall	564
Experiments with hops, Remy	564
Seed selection of oats, J. Huntemann	564
Paspalum dilatatum	565
Potato experiments in 1901, B. D. Halsted	565
Fertilizer experiments with rape	565
Cane sugar and the process of its manufacture in Java, H. C. Prinsen-Geerligs	565
Experiments with sugar cane, C. F. Eckart	565
Chlorids in tobacco, W. H. Pegram	566
Experiments with wheat at Grignon in 1902, P. P. Dehérain and C. Dupont	566

HORTICULTURE.

Report of the assistant in horticulture, A. T. Jordan	566
Experiments in crossing plants, B. D. Halsted	568
Plant breeding and improvement in our experiment stations, B. D. Halsted	569
Apparent exceptions to the Mendel law of dissociation in hybrids, C. Correns	569
Experiments with salad plants, B. D. Halsted	569
Culture of vegetables, E. Yunge	570
Use of commercial fertilizers for market gardening, J. Aeby and E. Hegh	570
Experiments in onion growing at Dominica	570
New way to transplant	570
The Russian apple and its outcome; behavior in the Northwest, A. T. Erwin	570
Cold storage of apples, F. W. Rane, H. H. Lamson, and F. W. Morse	570
Experiments in preserving winter fruits in peat, E. Yunge	571
Culture and manufacture of tea in British India and Ceylon, A. Schulte	572
The book of the strawberry, E. Beckett	572
Self and cross pollination, R. Goethe	572
Study of grape seeds, A. Bonnet	572
Report of the viticultural station at Eibingen, R. Goethe et al	572
The carob tree, A. Guyader	573
English pleasure gardens, Rose S. Nichols	573
The book of climbing plants, S. Arnott	573
The book of old-fashioned flowers, H. Roberts	573
A plea for hardy plants, J. W. Elliott	573
Collection of Haarlem flowers	573
A new hybrid poppy, F. Cayeux	573
Experiments with phloxes and their allies, B. D. Halsted	574
Experiments with ornamental plants, B. D. Halsted	574
Experiments with lawn grasses, B. D. Halsted	574

FORESTRY.

The western hemlock, E. T. Allen	574
The hardy catalpa in commercial plantations, W. L. Hall	574
Eucalypts cultivated in the United States, A. J. McClatchie	575
A history of the lumber industry in the State of New York, W. F. Fox	575
Report of the superintendent of forests, W. F. Fox	575
A study in practical reforesting, J. Y. McClintock	576
Culture experiments with foreign trees in Austria, A. Cieslar	576
The woodman's handbook, I, H. S. Graves	576
Methods of estimating and measuring standing timber, A. Knechtel	576
Wood, G. S. Boulger	576
Forest-reserve manual	577

SEEDS—WEEDS.

Page.
The germination of seed as affected by sunlight, V. Jodin 577
Observations on the duration of the germinative property of seeds, J. Poisson. 577
The preservation of the germinative power of seeds, L. Maquenne 577
Report of the section of seed control, A. Voigt 577
Report of the seed control station at Hernösand, C. G. Strokirk 578
Report of the seed control station at Luleå, 1900–1901, P. Hellström 578
Report of the seed control station at Molkom, 1901, J. A. Andersson 578
A study of dodders, B. D. Halsted 578
Experiments with weeds, B. D. Halsted 578

DISEASES OF PLANTS.

Report of the botanist, B. D. Halsted 578
Plant diseases observed during 1901, E. Marchal 579
A report on cotton disease in Egypt, F. Fletcher 579
A disease of potato stems in Ohio, due to Rhizoctonia, A. D. Selby 580
Observations on the foot disease of wheat, L. Mangin 580
Hot water treatment of oats and wheat for smut prevention, H. Rommetin .. 580
Bacterial soft rot of cruciferous plants, H. A. Harding and F. C. Stewart 580
New organism producing rot in cauliflower and allied plants, F. C. Harrison . 581
Club root of cabbage, L. Mangin 581
The banana disease, G. P. Foaden 581
Bitter rot of apples, T. J. Burrill and J. C. Blair 581
Pear blight in California, N. B. Pierce 582
Notes on canker and black rot, P. J. O'Gara 582
The gray rot of grapes, R. Roger 582
Diseases of the hardy catalpa, H. von Schrenk 583
Notes on some diseases of western conifers, H. von Schrenk 583
Prevalence of Alternaria during drought of 1901, G. G. Hedgcock 583
Sclerotinia fructigena, J. B. S. Norton 583
Arachniotus trachyspermus, a new species of the Gymnoascaceæ, C. L. Shear .. 583
The finding of *Puccinia phragmitis* in Nebraska, J. M. Bates 583
North American Ustilagineæ, G. P. Clinton 583
Notes on some west American fungi, P. L. Ricker 584
Plant pathological stations in northern Europe, E. Marchal 584

ENTOMOLOGY.

Fourteenth annual meeting of the Association of Economic Entomologists 584
Report of the entomologist, J. B. Smith 586
Report of the botanist and entomologist, G. W. Herrick 587
Winds and storms as agents in the diffusion of insects, F. M. Webster 587
Flowers and insects in New Mexico, T. D. A. Cockerell 587
Injurious insects, E. Fleutiaux 587
Injurious insects observed in Ireland during the year 1901, G. H. Carpenter .. 587
Insects injurious to fruit and vegetables, H. T. Fernald 587
Inspection of fruits and plants; orchard notes for August, G. Quinn 587
Insects injurious to fruit trees, H. Faes 587
Suggestions for controlling importation of insect pests, H. Maxwell-Lefroy 587
Certain leaf-eating caterpillars of the sugar cane, W. van Deventer 588
Cane borer (*Diatræa saccharalis*), W. C. Stubbs and H. A. Morgan 588
The turnip sawfly and injuries caused by it in vicinity of Paris, P. Marchal ... 588
The fruit fly, J. Lindsay 589
Winter treatment of the San José scale, W. M. Scott and W. F. Fiske 589
The codling moth, G. Quinn 590
Spraying tests for the codling moth, G. Quinn 590
The peach worm, W. T. Clarke 590
Insects of the wattle trees, W. W. Froggatt 591
The effect of *Aphrophora salicis* on willows, A. Jacobi 591
Felted beech coccus 591
Hydrocyanic-acid gas in greenhouses, H. C. Price 591
Fumigation under box covers, C. P. Lounsbury 591
Ortel's traps for catching locusts, R. de Saint-Foix 592
Alphabetical index to North American Orthoptera, S. H. Scudder 592
The salt-marsh mosquito (*Culex sollicitans*), J. B. Smith 592

Page.
Clothes moths 592
Furniture beetles 592
Economy in bee keeping, E. Forrest 592
Apiculture and serotherapy, P. Robinet 592
Foul brood and its prevention in Ireland 592
Bombyx faidherbei, Dumas 593

FOODS—NUTRITION.

Scope and results of the nutrition investigations, A. C. True 593
The form in which starch occurs in fresh and stale bread, L. Lindet 593
Effect of decortication and grinding upon assimilation, and experiments on the effect of adding wheat flour to rye bread, K. B. Lehmann 593
Rice for bread making, H. Neuville 593
Some uses and abuses of common foods, Emma J. Davenport 593
Canned salmon, T. Macfarlane 594
Composition of poi, E. C. Shorey 594
Uses of marine algæ in Japan, K. Yendo 594
The use of bamboo seed as food, M. Wallinger 594
Cocoa and chocolate, A. McGill 594
Cloves, T. Macfarlane 594
Subject list of works on domestic economy, foods, and beverages 594
Technical education of bakers and confectioners, C. T. Millis 594
Concerning tin from a hygienic standpoint, K. B. Lehmann 594
Fruit sugar in the fluids of the human body, C. Neuberg and H. Strauss 594
Digestibility of fats and oils, with special reference to emulsions, J. W. Wells 594
Concerning the effect of muscular work upon metabolism, I. Kaup 594
Albumin in relation to the feeding problem, Finkler and H. Lichtenfelt 595
Experiments on the amount of food required daily by man, R. O. Neumann 595

ANIMAL PRODUCTION.

Analyses of commercial feeding stuffs, J. L. Hills, C. H. Jones, and B. O. White 595
Fodders and feeds, L. A. Voorhees and J. P. Street 595
By-products of the starch industry in the United States 595
Zein as a nutrient, I. W. Szumowski 595
Experiments on composition and digestibility of dried potatoes, O. Kellner et al 596
Sugar-cane fodder, L. Acutt 596
Concerning sunflower-seed cake, R. Windisch 596
Fodder value of barley grass, F. B. Guthrie and A. A. Ramsay 596
Protein cleavage when the supply is abundant, O. Frank and R. Trommsdorff 596
The cleavage of carbohydrates by animal and plant ferments, W. N. Clemm 596
Behavior of glycogen in boiling potassium hydroxid solution, E. Pflüger 596
The glycogen content of the cartilage of vertebrates, E. Pflüger 596
The glycogen content of the skeleton, M. Händel 596
Concerning the saponification which is brought about by gall and the estimation of soaps in presence of fatty acids in gall mixtures, E. Pflüger 596
The physiological action of formaldehyde, W. Koch 597
Concerning the modifications which warm and moist surroundings produce in the respiratory quotient, V. Grandis and C. Mainini 597
Market classes and grades of cattle, etc., H. W. Mumford 597
Feeding native steers, A. M. Soule and J. R. Fain 598
Feeding experiments, E. R. Lloyd 600
Cattle rearing in Egypt, J. L. Smith 600
Swine feeding in Colorado, B. C. Buffum and C. J. Griffith 600
Influence of condimental stock food in fattening swine, C. S. Plumb 602
Giant lily as a food for pigs 602
Organized poultry work in England, G. M. Curtis 602
Scientific studies of oyster propagation, J. Nelson 602

DAIRY FARMING—DAIRYING.

Dairy husbandry, H. J. Waters and C. H. Eckles 603
Report of the assistant in dairy husbandry, C. B. Lane 603
Alfalfa, cowpeas, and crimson clover as substitutes for feeds, C. B. Lane 604
Relative value of protein in cotton-seed meal, cowpea hay, and wheat bran, A. M. Soule and S. E. Barnes 605

Page.
Apple pomace a good feed for cows, J. L. Hills 606
Feeding experiments, J. S. Moore 606
Record of dairy herd, J. S. Moore 606
Some of the influences affecting milk production, L. Anderson 606
A study of some of the salts formed by casein and paracasein with acids: Their relations to American Cheddar cheese, L. L. Van Slyke and E. B. Hart 607
Milk in relation to public health, G. M. Kober 608
The creamery patron's handbook 608
Creameries in foreign countries 608
Thirteenth annual meeting of the Missouri State Dairy Association, 1902 609

VETERINARY SCIENCE AND PRACTICE.

The transference of bovine tuberculosis to man, R. Koch 609
Are bovine and human tuberculosis identical or not? E. Klebs and Rievel 609
Immunization of cattle against tuberculosis, L. Pearson and S. H. Gilliland 609
Is the ingestion of the meat of tuberculous animals dangerous? V. Galtier 610
Indemnity to butchers for animals found to be tuberculous, V. Galtier 610
The history of a tuberculous herd of cows, C. L. Beach 610
Contributions to our knowledge of bovine tuberculosis, J. Nelson 611
Eggs as a medium for the cultivation of *Bacillus tuberculosis*, M. Dorset 611
Treatment of anthrax, Möbius 611
Recovery of a cow from anthrax, W. Ortmann 611
The intravenous application of corrosive sublimate, Schmidt 611
A fatal case of induced Texas fever, C. F. Dawson 612
Observations on Bacelli's method of treating foot-and-mouth disease, Koske 612
The treatment of foot-and-mouth disease, Weinsheimer 612
Bovine eczema, C. Brégeard 612
Abortion in cows, P. Malcolm 612
Infectious pneumonia of calves, H. Marder 612
Treatment of sheep scab, Nagel 612
Experiments with Bacillol sheep dips, K. Kasselmann 613
The Landsberger Swine Erysipelas Serum, B. Schubert 613
Vaccination with septicidin for swine plague and hog cholera, 1901, Schreiber 613
Vaccination with vaccine from Swine Erysipelas Institute at Preslau, Helfers 613
Vaccinations made in Province of Saxony with Lorenz Vaccine, H. Raebiger 613
Observing a uniform technical procedure in trichina inspection, Weber 613
The transmission of glanders, etc., V. Galtier 614
Treatment of azoturia with potassium iodid, T. S. Childs 614
Surra, J. J. Vassal 614
The tsetse fly disease, A. Proost 614
South African horse disease, Rickmann 614
Critical notes on the treatment of colic in horses, Witt 614
Pathology and differential diagnosis of infectious diseases, V. A. Moore 614

AGRICULTURAL ENGINEERING.

The scope and purpose of the irrigation investigations, E. Mead 615
Operations at river stations, 1901 615
Pumping water for irrigation 615
Municipal engineering and sanitation, M. N. Baker 615
Cane-cutting machinery in Australia 615
Oil for roads, O. W. Longdon 615

MISCELLANEOUS.

Annual Report of the Office of Experiment Stations, 1901 615
Sixth report of extension work, J. Craig 616
Review of foreign literature relating to agriculture, 1900, T. Westermann 616
Yearbook of the natural sciences, 1901–2, M. Wildermann 616

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Page.

California Station:
Bul. 144, Sept., 1902 590
Colorado Station:
Bul. 74, Sept., 1902 600
Connecticut Storrs Station:
Bul. 24, Nov., 1902 610
Hawaiian Sugar Planters' Station:
Rpt., 1902 ..... 554, 565
Illinois Station:
Bul. 76, July, 1902 563
Bul. 77, July, 1902 581
Bul. 78, July, 1902 597
Indiana Station:
Bul. 93, June, 1902 602
Kansas Station:
Bul. 114, June, 1902 564
Fifteenth An. Rpt., 1902 616
Kentucky Station:
Bul. 102, Sept., 1902 558
Louisiana Stations:
Bul. 70 (second series), Apr., 1902 588
Mississippi Station:
Bul. 77, Sept. 1, 1902 558
Fifteenth An. Rpt., 1902 ..... 561, 587, 600, 606, 616
Missouri Station:
Bul. 56, Jan., 1902 603
New Hampshire Station:
Bul. 93, Oct., 1902 570
New Jersey Stations:
Bul. 161, Aug. 30, 1902 604
An. Rpt., 1901 ..... 557, 558, 565, 566, 568, 569, 574, 578, 586, 595, 602, 603, 611, 616

Stations in the United States—Continued.

New York Cornell Station:
Bul. 206, Oct., 1902 616
New York State Station:
Bul. 214, July, 1902 607
Bul. 215, Sept., 1902 545
Bul. 216, Sept., 1902 558
Tennessee Station:
Bul., Vol. 15, No. 3, July, 1902 598
Bul., Vol. 15, No. 4, Oct., 1902 605
Vermont Station;
Bul. 96, Sept., 1902 606
Bul. 97, Sept., 1902 595
Wyoming Station:
Bul. 55, Sept., 1902 550

U. S. Department of Agriculture.

Bureau of Forestry:
Bul. 33 574
Bul. 34 575
Bul. 35 575
Bul. 36 576
Bul. 37 ..... 574, 583
Weather Bureau:
Monthly Weather Review, Vol. 30, Nos. 4–9, Apr.–Sept., 1902 551
Monthly Weather Review, vol. 30, No. 7, July, 1902 552
Doc. 273 553
Office of Experiment Stations:
An. Rpt., 1901 ..... 558, 560, 593, 615
Division of Biological Survey:
Bul. 17 549
Division of Entomology:
Bul. 37 (new series) 584

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The EDITOR and H. W. LAWSON.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. BEAL.
Botany and Diseases of Plants—WALTER H. EVANS, Ph. D.
Foods and Animal Production—C. F. LANGWORTHY, Ph. D.
Field Crops—J. I. SCHULTE.
Entomology and Veterinary Science—E. V. WILCOX, Ph. D.
Horticulture—C. B. SMITH.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 7.

	Page.
Editorial notes: Agricultural experimentation in the Philippine Islands	621
Values in science, W. H. Jordan, Ph. D	625
Recent work in agricultural science	630
Notes	720

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

Determination of phosphoric acid by means of ammonium phospho-molybdate, G. P. Baxter	630
Determination of phosphoric acid in Wiborgh phosphate, M. Weibull	630
Determination of total phosphoric acid and potash in soils, C. B. Williams	630
On the determination of potash by the modified Finkener method, H. Neubauer	631
The supposed loss of potash in incineration, R. Woy	631
Determination of the active constituents of marl and limestone, H. Bode	631
New apparatus for the determination of nitrogen, C. Porcher and M. Brisac	631
Analytical methods for carbohydrates as applied to foods and feeding stuffs, W. H. Krug	631
Study of methods of cattle food analysis, C. A. Browne, jr., and C. P. Beistle	631
The Halphen reaction in examination of butter, B. Sjollema and J. E. Tulleken	631
Wijs' method of determining the iodin value of oils and fats, T. F. Harvey	631
Determination of boric acid in margarin, A. Beythien	632
Determination of alcohol in very dilute solutions, G. Argenson	632
Observation on the occurrence and properties of cholin, H. Struve	632
Determination of carbon monoxid and dioxid in vitiated air, F. Jean	632
Analysis of atmospheric air, O. Rebuffat	632
Miscellaneous analyses, M. E. Jaffa	632
International catalogue of scientific literature. D—Chemistry	632
Chemicals and allied products, C. E. Munroe and T. M. Chatard	632

BOTANY.

Chlorophyll assimilation at low atmospheric pressure, J. Friedel	633
Injurious effect of smoke and gases on plant growth, E. Haselhoff and G. Lindau	633

Page
Injurious effects of premature pollination, C. P. Hartley 634
Mendel's principles of heredity. A defense, W. Bateson 634
Studies in the physiology of heredity, W. Bateson and Miss E. R. Saunders.. 634
Variation in *Trillium grandiflorum*, H. W. Britcher 634
Comparative anatomy of the styles and stigmas of phanerogams, F. Guéguen. 634
Morphology and physiology of the germination of Spermaphytes, A. J. J. Vandevelde 635
Studies on tuber formation, N. Bernard 635
Electric response in ordinary plants under mechanical stimulus, J. C. Bose... 635
Method of investigating the gravitational sensitiveness of root tip, F. Darwin. 635
Root pressure in Begonia, J. B. Dandeno 635
Calcium oxalate crystals in seedlings of alsike clover, J. Percival 636
On the localization of daphnine in *Daphne laureola*, W. Russell 636
Report of the botanist, C. E. Bessey 636
Catalogue of grasses of Belgium and their fungus parasites, H. Vanderyst.... 636
Notes on plants received for identification, J. B. Davy 636
Studies on reproduction of some higher fungi, A. de Gomont de Lesparre.... 636
A monograph of Amanita and Lepiota, L. Quélet and F. Bataille 637
A simple respiration apparatus, H. H. Dixon 637
Biological laboratory methods, P. H. Mell 637
Sectioning without embedding, H. H. Dixon 637
International catalogue of scientific literature. M—Botany 637

METEOROLOGY.

Meteorological observations, A. O. Leuschner and J. D. Maddrill 637
Meteorological observations, J. E. Ostrander and S. C. Bacon 637
Meteorological observations in Nebraska, 1901, G. D. Swezey 638
Meteorology, C. W. Norris 638
Meteorological observations at Verona, 1901, G. Fracastaro 638
Rainfall at Manurial and Variety Experiment Stations, Barbados 639
Composition of Barbados rainfall 639

WATER—SOILS.

Laboratory study of percolation of water through soils, A. V. Stubenrauch... 639
The motions of underground waters, C. S. Slichter 640
Field operations of the Bureau of Soils, 1901, M. Whitney et al 640
Soil analyses, W. Frear and C. P. Beistle 643
Some Cuban soils of chemical interest, W. Frear and C. P. Beistle 644
First report on the soils of Kent and Surrey, A. D. Hall and F. J. Plymen ... 644
Results of investigations of Turkestan soils, P. Kossovich et al 644
Soils and vegetation of Western Siberia, A. Gordyagin 644
Mechanical and chemical examination of soils, R. H. Loughridge 644
Alkali reclamation at Tulare Substation, C. H. Shinn 644
Alkali and alkali land, R. H. Loughridge 645
Irrigation, cultivation, and hardpan, E. W. Hilgard 645
Fixation of phosphoric acid in the soil, J. T. Crawley 645
Fixation of ammonia and potash by Hawaiian soils, J. T. Crawley and R. A. Duncan 645
Predominating processes of soil formation, P. Slyezkin 645
Report of the geologist, E. H. Barbour 646
Effects of different systems of manuring upon humus, W. Frear and E. H. Hess 646
Maintenance of soil fertility under the renting system, H. Bode 647
Limestones, W. Frear 647
Nitrogen-fixing bacteria, J. G. Lipman 647

FERTILIZERS.

Experiments with phosphatic fertilizers on winter grain, O. Reitmair 647
Do phosphoric and potassic fertilizers exert influence upon plants? C. Luma. 647
The returns from top-dressing with potash salts, Bachmann 647
Potash fertilizing of barley and replacement of potash by soda, P. Doll 648
Work of Ivanov Experiment Station, Kharkov 1901, J. M. Zhukov 648
Demonstration fertilizer experiments in Lower Austria, 1901, O. Reitmair.... 648
Green manuring experiments in Pomerania, Baessler 648

Page.
Directions for making local fertilizer experiments, K. Hansen 648
The use of plaster in agriculture, L. Grandeau 648
Commercial fertilizers, E. H. Jenkins et al 649
Fertilizer inspection, C. D. Woods and J. M. Bartlett 649
Analyses of commercial fertilizers and manurial substances, C. A. Goessmann 649
Composition of waste materials of farm, orchard, and vineyard, G. E. Colby 649
Use of commercial fertilizers, G. M. Tucker 649
Fraud in phosphatic slags, Maizières 649
The phosphate industry in 1902, C. C. Schnatterbeck 649

FIELD CROPS.

Report of the North Louisiana Experiment Station, 1901, D. N. Barrow 650
Fixation of atmospheric nitrogen by alfalfa on prairie soil, C. G. Hopkins 650
Experiments with barley, Remy 650
Berseem, D. G. Fairchild 651
Experiments with white clover, P. P. Dehérain and E. Demoussy 651
Varieties of white clover, C. Fruwirth 652
Manual of corn judging, A. D. Shamel 652
Analyses of hop cones and hop vines, G. E. Colby 652
Experiments with yellow lupines, P. P. Dehérain and E. Demoussy 652
Variety tests of oats and potatoes, G. C. Watson and E. H. Hess 652
Saltbushes in the Southern Coast Range, C. H. Shinn 653
Analyses of sugar beets, M. E. Jaffa 653
The beet sugar industry in Victoria, A. N. Pearson 653
Localization of phosphates in the sugar cane, C. H. G. Sprankling 653
Seedling and other canes in the Leeward Islands, 1901–2 653
Seedling and other canes at Barbados, 1902 653
Report of agricultural work, 1900–1902, J. P. d'Albuquerque and J. R. Bovell 654
Origin of starch in the wheat grain, P. P. Dehérain and C. Dupont 654

HORTICULTURE.

Specific variation in the graft of asexual hybridization, L. Daniel 654
Curious results obtained in grafting, L. Daniel 656
Specific variations in the graft, G. T. Grignan 656
Specific variations caused by grafting 656
Increase in yield of crops obtained by electrical treatment, S. Lemström 656
Growing vegetables under cloth 656
Sewage and night soil or stable manure and commercial fertilizers for vegetables, J. P. Wagner 657
List of American varieties of vegetables, 1901 and 1902, W. W. Tracy, jr 657
The fog fruit or *Lippia nodiflora* as an economic plant, J. J. Thornber 657
Ginger, G. Landes 658
Propagation of the mango, G. W. Oliver 658
The culture of onions in Holland, A. Pion 658
Peas put to the test, E. S. Brown 658
Manurial experiments with peas 658
Cultivation of pepper, V. Sebastian 658
Forcing tomatoes, A. C. Beal 658
Aggregate atavic mutation of the tomato, C. A. White 660
Edible native bulbs, E. Braunton 660
Orchard studies.—I. The fruit plantation. Pome fruits, W. B. Alwood 660
Climatic influences on chemical composition of apples, R. Otto 660
Astrakhans exported successfully 660
The book of pears and plums, E. Bartrum 660
Fruiting of the hardy orange 661
Comparative examination of shipping navel oranges, G. E. Colby 661
Diagrams for packing citrus fruits, H. H. Hume 661
Smyrna figs, G. E. Colby 662
Culture and preparation of cacao in Trinidad, A. Élot 662
The tea plant, F. Coulombier 662
Tests of potash fertilizers on vines, E. Marre 662
The preparation of Malaga raisins, V. Sebastian 662
Expedition to Central and South America, P. Preuss 662
First year in tropical agriculture, G. Saussine 663

Page.
Refrigerator cars 663
Forcing branches of hardy shrubs 663
Correlation between the color of roots of carnations and the flowers 663
Raising gladiolus hybrids 663
The book of orchids, W. H. White 663
Greenhouse construction and management, S. T. Maynard 663

FORESTRY.

Economics of forestry, B. E. Fernow 663
Among green trees, Julia E. Rogers 664
Studies of trees in winter, Annie O. Huntington 664
Timber resources of the United States 664
History of the lumber industry in the State of New York, W. F. Fox 664
Manuring woodlands 664
The use of nitrate of soda in sylviculture, J. Huberty 665
Tree growing in Nebraska, C. E. Bessey 665
Recent forest fires in Oregon and Washington, W. T. Cox 665
A plantation of European larch, A. F. Hawes 665
Contribution to the knowledge of the timber of the yew tree, G. Thoms 665
The mesquite, S. J. Holsinger 665
Difficulties and errors in stem analysis, A. S. Williams 666

DISEASES OF PLANTS.

Spore resistance of loose smut of wheat to formalin and hot water, W. Stuart 666
Experiments in the prevention of smut in oats, T. Johnson 666
The specialization of *Erysiphe graminis*, E. Marchal 666, 667
Cotton disease in Egypt, G. Delacroix 667
Cucumber and melon leaf blotch 667
The finger-and-toe in turnips 667
Notes on apple rusts, H. H. Whetzel 667
Pink rot, an attendant of apple scab, J. Craig and J. M. Van Hook 668
The bitter rot of apples, H. von Schrenk and P. Spaulding 668
Brown rot of stone fruits, F. T. Bioletti 668
A new disease of bananas 669
Brunissure of the grape, J. Dufour 669
A cause of brunissure, L. Ravaz 669
Possibility of combating downy and powdery mildew of grapes by the same application of fungicides, J. M. Guillon 669
Experiments for the prevention of gray rot, L. Ravaz 669
Resistance of *Botrytis cinerea* to metallic poisons, L. Degrully 670
A form of *Glœosporium nervisequum* on plane trees, J. Beauverie 670
Concerning *Tuberculina persicina*, E. Marchal 670
The rust of spruces, E. Marchal 670
Two fungus diseases of the white cedar, J. W. Harshberger 670
Studies of some tree-destroying fungi, G. F. Atkinson 671
Suggestions for removal of epiphytes from cacao and lime trees, A. Howard 671
The general treatment of fungoid pests, A. Howard 671

ENTOMOLOGY.

Some miscellaneous results of the work of the Division of Entomology 671
Elementary studies in insect life, S. J. Hunter 673
Report of the State entomologist, W. M. Schöyen 673
Studies on insects, E. Fleutiaux 673
Injurious insects, E. Fleutiaux 673
Corn billbugs in Illinois, S. A. Forbes 673
Extermination of the cane grub, A. J. Boyd 674
Cleonus punctiventris and green muscardine, S. G. Toporkov 674
Cleonus punctiventris and green muscardine, S. G. Toporkov 674
Cleonus punctiventris and muscardine, J. Danysz 674
Field insecticide work against San José scale, 1899–1902, S. A. Forbes 675
The use of hydrocyanic-acid gas in greenhouses, G. C. Butz 675
The white fly or plant-house aleurodes, W. E. Britton 675
"*Termes taprobanes*"—white ants as a pest of trees 676
Mites attacking beetles and moths, W. W. Smith 676

Page.
Destruction of injurious insects, especially *Hyponomeuta padella*, J. Laborde.. 676
Migratory locusts and means of combating them, L. Sander 676
Secondary adaptation of the front leg of *Gryllotalpa vulgaris*, C. Vaney 677
Review of North American species of Athysanus, H. Osborn and E. D. Ball.. 677
The butterflies of the vicinity of New York City, W. Beutenmüller..... 677
A natural history of the British Lepidoptera, III, J. W. Tutt..... 677
Some plants which live upon and in insects, J. L. Sheldon..... 677
The common spiders of the United States, J. H. Emerton..... 677
A short description of the Culicidæ of India, F. V. Theobald..... 677
The larvæ of Anopheles and Culex in winter, B. Galli-Valerio and G. Rochaz.. 677
Plans for the extermination of mosquitoes on Long Island, W. T. Cox et al... 677
Notes on a species of sandfly, W. R. Colledge 678
The horse botfly, C. French and J. R. Weir..... 678
Influence of feeding sugar and starch sirup upon honey, E. von Raumer 678
The long-tongued bees (Apidæ) of California, C. Fowler 678
Studies on the organism of foul brood of bees, U. Lambotte 678
Silks of the far East and French colonies; silkworms and related species, H. J. de Cordemoy..... 678

FOODS—NUTRITION.

Influence of preservatives upon food value of milk, C. F. Doane and T. M. Price 679
Effect of curdling with rennet upon digestibility of milk, R. Popper 680
Digestibility of food consumed with varying quantities of water, S. Růžička.. 680
Digestibility as shown by microscopical studies of feces, F. Schilling..... 680
Causes, variations, and significance of the color of the feces, L. A. Conner.... 680
Vegetable proteolytic enzyms, with special reference to papain, L. B. Mendel.. 680
A new method of measuring the effect of pepsin, E. I. Spriggs..... 681
Effect of chemical bodies upon activity of pancreas diastase ferment, P. Grützner 681
The process of digestion in the small intestines, F. Kutscher and J. Seemann. 681
Resorption of simple stereoisomeric sugars in the small intestine, J. Nagano... 681
Action of the strawberry on lymph flow, L. B. Mendel and D. R. Hooker.... 681
Formation of sugar from protein, O. Loew 681
Formation of sugar from fat, O. Loewi..... 682
Flour produced in the gradual reduction of wheat, F. B. Guthrie and G. W. Norris 682
Reports upon food and drug inspection, 1901, A. E. Leach 682
Second report on food products for 1901, B. W. Kilgore..... 682
Adulteration of food..... 682
Dietaries for hospitals for the insane, W. O. Atwater 682
In Danish and Russian old age homes, Edith Sellers..... 683
Commercial food alimentary pastes, A. Juckenack and R. Sendtner..... 683
Cocoanut butter, P. Pollatschek..... 683
Household economics, Helen S. Campbell..... 683
Practical cooking and serving, Janet McK. Hill 683
Harper's cook book encyclopædia 683
Foods and food control, W. D. Bigelow..... 683

ANIMAL PRODUCTION.

Commercial feeding stuffs in Pennsylvania, W. Frear..... 683
Miscellaneous cattle food analyses, W. Frear..... 684
The by-products obtained in grinding wheat and rye, F. Otto 684
The purchase of feeding stuffs..... 684
Report on molasses feeds, C. V. Garola 684
Influence of lecithin on development of the skeleton and nerve tissue, A. Desgrez and A. Zaky 684
The way in which lecithin acts in the animal body, A. Desgrez and A. Zaky.. 684
Metabolism of growing dogs, E. Rost 684
Methods of steer feeding, G. C. Watson and A. K. Risser 684
Cattle feeding with sugar beets and sugar-beet residuum, L. S. Ware..... 685
The business of breeding pure-bred stock, J. A. Craig..... 685
Breeds of beef cattle and beef production in North Carolina, T. Butler 685
The cattle industry of the United States, J. Wilson..... 685
Cattle markets and abattoirs in Europe, H. E. Alvord 685
History of the farm animal industry of Westphalia, J. Kleinsorge 685

Page.
The musk ox, G. F. Thompson 685
Sheep breeding, W. L. Carlyle and T. F. McConnell 685
The maintenance ration of sheep, W. W. Cooke 686
Lamb-feeding experiments, 1900–1902, B. C. Buffum and C. J. Griffith 689
Feeding beet pulp to lambs, H. H. Griffin 690
Lamb feeding in Colorado, L. Clarke 691
Progress of the Angora goat industry in 1901, G. F. Thompson 691
The Angora goat industry of Asia Minor, W. C. Bailey 691
Economic feeding of plantation stock under present conditions, W. C. Stubbs 691
Preparation of molasses feeds on the farm, A. Grégoire 691
Molasses as food 691
Maintenance and restoration of muscular energy by sugar, L. Grandeau 691
Molasses for feeding animals; its use in feeding draft animals, L. Grandeau 692
Feeding molasses; ration for horses and cattle, L. Grandeau 692
Molasses feeds and the feeding of horses, L. Grandeau 692
Molasses feeds for horses. Experiments with peat molasses, L. Grandeau 692
Molasses feeds for horses. Experiments with molasses-straw, L. Grandeau 692
Practical guide for horse buyers, J. Pertus 692
The horse and different breeds of horses, F. A. and E. S. Zürn 692
The question of temperament in raising army horses in Prussia, O. Gagzow 692
American breeds of fowls, T. F. McGrew 692
Preservation of eggs 692
Turkey culture 692
The national standard squab book, E. C. Rice 693
Profit in quail breeding 693

DAIRY FARMING—DAIRYING.

The dairy industry and dairy markets in Porto Rico, R. A. Pearson 693
Investigations of methods of milking, F. W. Woll 694
The use of molasses in the feeding of animals, L. Nicolas 695
A milk unusually rich in solids, M. H. Pingree 695
Composition of milk in the North of England, S. H. Collins 695
Milk at Copenhagen, H. de Rothschild 695
A new bacterium of soapy milk, *Bacterium sapolacticum*, W. Eichholz 695
A study of some California butters made for export, M. E. Jaffa 695
Composition and properties of butter fat from the milk of individual cows, P. Behrend and H. Wolfs 695
The nonsaponifiable substance in butter fat, A. Kirsten 696
Constituents of Emmenthaler cheese, E. Winterstein and J. Thöny 696

VETERINARY SCIENCE AND PRACTICE.

Bactericidal action of blood serum and blood plasma, A. Pettersson 696
Antibodies of the blood serum in animals treated with Blastomycetes, F. Sanfelice 696
Mutual reaction between successive processes of immunization, L. Verney 696
Immunization experiments with Kraus' bacillus of rabbit influenza, E. Jacobitz 697
The effect of glycerin on virus, V. Galtier 697
Aseptic metallic powder, L. Hoffmann 697
The action of aseptic metallic powders, Schmidt 697
Therapeutic application of formaldehyde in a fixed form, F. Glage 697
Tuberculosis of animals in relation to human tuberculosis, D. E. Salmon 698
Virulence of bovine tuberculosis bacillus, E. A. de Schweinitz and E. C. Schroeder 698
Composition of tubercle bacilli, E. A. de Schweinitz and M. Dorset 698
Branched forms of tubercle bacilli found in cultures, M. Dorset 698
Agglutination of tubercle bacilli and treatment of tuberculosis with the new tuberculin of Koch (bacterial emulsion), F. Thellung 698
Causes and suggestions for prevention of tuberculosis, H. D. Holton 699
Tuberculosis of the udder, A. Moser 699
Tuberculosis in the nerve centers in dogs, G. Petit 699
Foot-and-mouth disease, E. Thierry 699
Foot-and-mouth disease of cattle and its treatment, H. Meissner 699
Central nervous system in cases of foot-and-mouth disease, G. Scagliosi 699
Anthrax and blackleg, L. C. Tiffany 700

Page.
Anomalous forms of anthrax bacillus, J. Lignières and H. Durrieu 700
Toxic paralysis of a carbunculous (anthrax) nature, A. Sclavo 700
Existence of chronic pleuro-pneumonia in interior of France, H. Martel 700
Pleuro-pneumonia in the mammary gland, E. Nocard 700
Pasteurellosis of cattle in Indo-China, J. Blin and J. Carougeau 701
Prevention of white scour in calves 701
Hints for spaying cattle, D. Wilson 701
Danger from ergot and wild rye, A. T. Peters 701
Laboratory notes on poison in sorghum, S. Avery 701
Equisetum palustre, C. A. Weber 701
Screw worm in cattle at St. Lucia, H. Maxwell-Lefroy 702
Sour grass and ticks 702
Treatment of Strongylidæ in sheep, Moussu and Marotel 702
Frogs, toads, and carp as eradicators of fluke disease, C. W. Stiles 702
Results of the work against sheep scab in 1901, D. E. Salmon 702
Sheep scab 702
Vaccination of Algerian sheep and control of sheep pox, E. Nocard 703
Virulence of the wool of sheep affected with pox, L. Duclert and A. Conte 703
Blood poisoning in sheep and lambs in New Zealand, J. A. Gilruth 703
"Big head" of sheep in Utah 703
Hog cholera 703
Hog cholera bacillis which closely resembles *Bacillus typhosus*, M. Dorset 703
Serum diagnosis of glanders, A. Rabieux 704
Peculiar case of glanders in a horse, Rickman and Käsewurm 704
An epizootic of herpes among young horses, Froehner 704
Partial report upon investigation of horse sickness, H. Watkins-Pitchford 704
Latent parasitism and immunization against dourine, Buffard and Schneider 705
Diarrhea of new-born colts, E. Thierry 705
The treatment of so-called colt lameness, A. Marcus 705
Petechial fever of horses, and its treatment by the serum of Marmorek 705
Treatment of morbus maculosis with serum of contagious coryza streptococcus, O. Sommermeyer 705
Contagious coryza and certain analogous diseases, Cagny 705
Treatment of contagious coryza by colloidal silver, Baumgart 706
Treatment of tetanus with a slow course by means of antitetanus serum, Marchal 706
A new method of cultivating the tetanus bacillus, L. Debrand 706
Action of dry heat on the spores of tetanus bacillus, V. Morax and A. Marie 706
Glycosuria in rabies; its importance in diagnosing this disease, A. Rabieaux and E. Nicolas 706
Antirabies; immunization by means of intravascular injections of rabies virus, V. Krasmitski 707
A new infectious disease in domesticated animals, A. Aujeszky 707
Meningitis in dogs, C. Cadéac 707
Eczema rubrum of the dog, H. Bär 707
Ringworm in dogs, Matruchot and Dassonville 707
Bothriocephalus latus in cats, B. Galli-Valerio 708
Death of domesticated animals attributed to cultures used for killing mice 708
Fowl plague, E. Centanni 708
Combating fowl cholera, Buhl 709
Psittacosis, G. Ajello and C. Parascandolo 709
Bacterial flora of the feces of fowls, with notes on a new fowl plague, E. Joest 709
Recent American cases of hookworm disease in man, C. W. Stiles 709
The burning of dead animals, R. H. McDowell 709
Inspection of foreign and interstate shipments of live-stock, D. E. Salmon 710
Food products from diseased animals, D. E. Salmon 710
Contagious diseases of animals in foreign countries 710
Report of the veterinarian, A. T. Peters 710
Reports of the inspectors of stock, H. R. Mackenzie et al 710
Number of animals slaughtered and found diseased in Prussian abattoirs, 1900 710
Text-book of veterinary medicine, IV, J. Law 710
Symptoms and treatment of the diseases of domestic animals, B. Schmidt 711

TECHNOLOGY.

Manufacture of table sirups from sugar cane, H. W. Wiley 711
Manufacture and preservation of unfermented grape must, G. C. Husmann 711

Page.
Wine-making experiments at Gard, 1901, E. Kiser and G. Barba 711
Changes in chemical composition of bilberry wine, R. Otto 711
The chemistry of cider, A. H. Allen 711
Experiments on cider making, report for 1901, F. J. Lloyd 711
The 1901 exhibition of cider, F. G. Farwell 711
The production of vinegar in cellars, W. B. Alwood and R. J. Davidson 712
New process in olive oil making 712
Tanning materials, G. E. Colby 712
Textile fibers of commerce, W. I. Hannan 712
Chemical technology of textile fibers, G. von Georgievics 712
The art of paper making, A. Watt 712
A new paper stock 713

AGRICULTURAL ENGINEERING.

Report of irrigation investigations for 1901, E. Mead et al 713
What the Department of Agriculture is doing for irrigation, E. Mead 714
Water supply and irrigation in Nevada, L. H. Taylor 714
Water storage in the Truckee Basin, California-Nevada, L. H. Taylor 715
Irrigation systems of Texas, T. U. Taylor 715
Irrigation from Big Thompson River, J. E. Field 715
Geology and water resources of the Patrick and Goshen Hole quadrangles in eastern Wyoming and western Nebraska, G. I. Adams 715
Report of the engineer, O. V. P. Stout 715
Irrigation in the Western Division, New South Wales, J. Wright 716
Some features of irrigation, W. O. Webber 716
Water powers of the State of Maine, H. A. Pressey 716
Water supply notes 716
The laws of Indiana for constructing ditches and levees, 1901 716
Land drainage 716
The bacterial disposal of sewage from country houses, G. J. G. Jensen 716
Sewage pollution in the metropolitan area near New York City and its effect on inland water resources, M. O. Leighton 716
Adaptation of the peat closet system to towns, Fraenkel, Pfeiffer, and Witt 716
Road conventions in the Southern States, and object-lesson roads 716
Wind power notes 716
Engine power notes 717
Electric power on German farms 717
The transportation of manure over uneven ground, H. Dupays 717
The American plow and the Russian farmer, T. E. Heenan 717
Development of the disk plow 717
The Derby land digger 717
The reaping machine 717
A sifting machine for grading oats and freeing grains from ergot, H. Walter 717
Comparative tests of seed cleaning and sorting machines 717
Notes on the building of stables and farmsteads, E. S. Wilson 717
The heating of poultry houses 717
The utilization of waste products, T. Koller 717

MISCELLANEOUS.

Imports and exports of animals and animal products, J. Roberts 718
Annual Report of the Bureau of Industries for Province of Ontario, 1901 718
Annual Report of Department of Agriculture of Northwest Territories, 1901 718
Report on agriculture, P. Gennadius 718
Industrial progress in North Carolina 718
History of German agriculture, T. von der Goltz 718
Agricultural and viticultural calendar, V. Vermorel 719
The country gentlemen's estate book, 1902, W. Broomhall 719
Timely hints for farmers 719
Secondary courses in agriculture, A. C. True et al 719
Proceedings of the seventh annual meeting of the American Association of Farmer's Institute Workers 719
Report of the farmers' institutes of the Province of Ontario, 1901 719
A list of bibliographies of special subjects 719

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Arizona Station: Page.
Bul. 45, Nov. 20,1902 ..... 657, 719
California Station:
Rpt. 1899–1901, pt. 2..... 632, 637, 639, 644, 645, 649, 652, 653, 661, 662, 668, 678, 695, 712, 717
Colorado Station:
Bul. 75, Sept., 1902 689
Bul. 76, Sept., 1902 690
Connecticut State Station:
Bul. 140, Sept., 1902..... 675
An. Rpt., 1902, pt. 1 649
Florida Station:
Bul. 63, Sept., 1902 661
Illinois Station:
Bul. 79, Oct., 1902..... 673
Bul. 80, Oct., 1902..... 675
Bul. 81, Nov., 1902 658
Louisiana Stations:
Bul. 71 (second series), 1902.. 650
Maine Station:
Bul. 85, Oct., 1902..... 649
Bul. 86, Nov., 1902 634
Maryland Station:
Bul. 86, Sept., 1902..... 679
Massachusetts Station:
Bul. 84, Nov., 1902 649
Met. Buls. 163–168, July–Dec., 1902 637
Nevada Station:
Bul. 52, June, 1902 714
Bul. 53, June, 1902 709
New York Cornell Station:
Bul. 207, Nov., 1902 668
Pennsylvania Station:
An. Rpt., 1901..... 631, 638, 643, 646, 652, 675, 683, 684, 686, 695, 717

Stations in the United States—Cont'd.

Virginia Station: Page.
Bul. 127, Aug., 1901 712
Bul. 128, Sept., 1901 660
Wisconsin Station:
Bul. 95, Aug., 1902 685
Bul. 96, Sept., 1902..... 694

U. S. Department of Agriculture.

An. Rpts., 1902..... 718
Rpt. 73 718
Bureau of Animal Industry:
Eighteenth An. Rpt., 1901. 685, 691, 692, 693, 698, 702, 703, 709, 710, 718
Bureau of Chemistry:
Bul. 69, pts. 1–5..... 683
Bul. 70 711
Bureau of Plant Industry:
Bul. 21..... 657
Bul. 22..... 634
Bul. 23..... 651
Bul. 24..... 711
Bureau of Soils:
Field Operations, 1901 (Third Report)..... 640
Office of Experiment Stations:
Bul. 118..... 715
Bul. 119..... 713
Bul. 120..... 719
Circ. 48..... 714
Circ. 49..... 719
Division of Entomology:
Bul. 38 (new series) 671
Public Road Inquiries:
Bul. 23 716

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The Editor and H. W. Lawson.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. Beal.
Botany and Diseases of Plants—Walter H. Evans, Ph. D.
Foods and Animal Production—C. F. Langworthy, Ph. D.
Field Crops—J. I. Schulte.
Entomology and Veterinary Science—E. V. Wilcox, Ph. D.
Horticulture—C. B. Smith.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 8.

Page.

Editorial notes:
The agricultural appropriation act, 1903–4 725
The Department publications 726
The soil survey in 1903 727
School garden at the Department of Agriculture 728
New buildings at the New Hampshire and Missouri agricultural colleges 729
Recent work in agricultural science 736
Notes 823

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

A new modification of the molybdic method, E. Riegler 736
Determination of phosphoric acid in fertilizers, A. G. Woodman 736
The valuation of Thomas slag, B. Sjollema 736
On the determination of citric-acid soluble phosphoric acid, M. Passon 737
Transformation of pyrophosphoric acid into orthophosphoric acid, H. Grian 737
On the determination of calcium in the form of oxalate, V. Paguiref 737
Rapid gravimetric method of estimating lime, F. B. Guthrie and C. R. Baker 737
On the determination of free lime in Thomas slag, M. Bischoff 737
Lime determination by means of Passon's apparatus, M. Passon 737
Passon's lime test, T. Pfeiffer 737
On the determination of perchlorates, M. Hönig 737
Titration method of determining hardness of water, A. Gawalowski 737
Volumetric method for the determination of tannin, A. Thompson 737
A method for the determination of glycerin in wine, A. Trillat 738
On albuminoid substance extracted from maize seed, E. Donard and H. Labbé 738
On musculamine, a new derivative from muscles, A. Etard and A. Vila 738
Experiments with Wollny's refractometer for milk analysis, S. Hals 738
First annual meeting of the Association of German Food Chemists 738
Synopsis for use in analysis and examination of preserved foods, C. Manget 738
Report of the Chemical Control Station, Trondhjem, Norway, 1901, T. Solberg 738
Annual report of progress in agricultural chemistry, 1901, A. Hilger et al 738
Annual report of progress in chemistry, 1894, G. Bodländer et al 738

BOTANY.

Page.
The effect of sunshine on plants, N. Passerini 739
Influence of X-rays on plants, H. Seckt 739
Electrical phenomena in plants, A. Tompa 739
Electric response in plants under mechanical stimulus, J. C. Bose 739
Concerning the respiration of injured leaves, N. Dorofejew 739
Influence of irritation on the growth of unicellular plants, J. Trzebinski 740
The permeability of protoplasm, Van Rysselberghe 740
Predisposition and immunity in plants, H. Marshall Ward 740
The origin of variegated varieties of plants, E. Laurent 740
Experiments on cereal improvement at Olbersdorf, G. Swoboda 741
The germination of potato tubers, H. Vöchting 741
Aleurone grains in oily seeds, B. Gram 741
Enzyms of the tea leaf, H. H. Mann 741
Alinit, C. Schulze 742
Energy of assimilation in fungi, T. Bokorny 742
Resistance of molds to metallic poisons, C. Pulst 742
The influence of a medium on the respiration of molds, S. Kostytschew 742
A few common fleshy fungi of Ames, Iowa, Alice W. Hess 742
New species of fungi from various localities, J. B. Ellis and E. Bartholomew 742
A monstrosity of *Boletus luteus*, C. Van Bambeke 742
Report of the New York State botanist, C. H. Peck 743
Report of the botanist, F. M. Bailey 743

BACTERIOLOGY—FERMENTATION.

Bacteriological investigations of Ames sewage disposal plant, L. H. Pammel 743
Bacteriological studies at the Lawrence experiment station, S. De M. Gage 743
The penetration of plant tissues by bacteria, G. Ellrodt 743
Assimilation of free nitrogen by bacteria, M. W. Beijerinck and A. van Delden 743
On conditions of light production in luminous bacteria, R. E. B. McKenney 744
The strawberry bacillus, W. Eichholz 744
Review of existing methods for cultivating anaerobic bacteria, O. F. Hunziker 744
Physiology and morphology of alcoholic ferments, E. C. Hansen 744
Growth and reproduction of yeasts, etc., E. C. Hansen 744
Influence of external factors on the assimilation of yeasts, T. Bokorny 745
The Benikoji fungus, Y. Uyeda 745

AIR—WATER—SOILS.

On the question of hydrogen in the atmosphere, Lord Rayleigh 745
On atmospheric hydrogen, A. Leduc 745
Quantity of free hydrogen in air and density of atmospheric nitrogen, A. Gautier 745
Researches on the blue color of the sky, G. Zettwuch 745
The chemical and geological history of the atmosphere, J. Stevenson 745
The climate and artesian waters of Australia, J. P. Thompson 745
Studies on the absorptive properties of decomposed rocks, M. Dittrich 746
Geology and water resources of Snake River Plains of Idaho, I. C. Russell 746
Studies on humus, T. Schloesing 748
A contribution to the study of tropical soils, J. D. Kobus and T. Marr 748
Banana soils of Jamaica, II, H. H. Cousins 748
Greensand marl, A. L. Parsons 748
Further contribution to the question, Can plant analysis show the fertilizer requirements of soils? C. von Seelhorst, H. Behn, and J. Wilms 748
Tubercle bacteria in relation to soils and fertilizers, Wohltmann and Bergené 749
Bacteria of the soil in their relation to agriculture, F. D. Chester 749

FERTILIZERS.

Fertilizers 749
Analyses and valuations of fertilizers, L. A. Voorhees and J. P. Street 749
Analyses of commercial fertilizers, J. Hamilton and W. Frear 750
Commercial fertilizers, H. J. Wheeler et al 750
Analysis of commercial fertilizers 750
Should manure be plowed under as soon as it is carried to the field? T. Remy 750
Comparative value of different phosphates, C. A. Mooers 750
Value of water-soluble phosphoric acid of double superphosphates, B. Schulze 750

Page.
Phosphate rock, J. Struthers 750
The Stassfurt industry 751
Gypsum, J. Struthers 751
Yearbook on the use of commercial fertilizers, 1903, M. Ullmann 751
Consumption of fertilizers 751

FIELD CROPS.

Results obtained in 1902 from trial plats of grain, etc., W. Saunders 751
Report on experiment stations in India, 1902, W. H. Moreland 752
Field trials at the Agricultural College of Norway, 1901, B. R. Larsen 753
Cooperative fertilizer experiments in Sweden, 1901, P. Bolin 753
Fertilizer tests with kainit and Thomas slag, V. von Knirim 753
Rotation experiments, A. L. Yakovlyev 753
Range improvement, J. J. Thornber 754
Hanna barley, A. Cserháti 754
Experiments with cotton in 1902, G. P. Foaden 754
Egyptian cotton, A. J. McClatchie 754
Rotation and inoculation of leguminous crops, C. Fruwirth 754
Studies on the potato, E. Bréal 754
Potash and phosphoric acid in the leaf ash of potato varieties rich in starch, J. Seissl and E. Gross 755
Variety tests with potatoes, E. S. Brown 755
The pollination and fecundation of rye, K. Ulrich 756
Saltbushes, J. J. Thornber 756
Sugar beets, R. H. Forbes and W. W. Skinner 756
The sugar beet, L. Geschwind and E. Sellier 756
Fertilizer experiments with sugar beets, D. N. Pryanishnikov 756
Variation in sugar content of swedes under different conditions, S. H. Collins 756
Wheat culture in Central and Southwestern Russia, A. Borchardt 756
Assimilation of plant food in wheat and rye, H. Juhlin-Dannfelt 756
Production of economic plants in the Desert of Sahara, E. Dürkop 757
Statistics of field crops 757

HORTICULTURE.

Problems in orchard pollination, G. O. Greene 757
Self-sterility of orchard fruits, Ewert 759
The sweating of apples, R. Otto 759
Cold storage of fruit 760
The relation of color to the killing of peach buds by cold, J. C. Whitten 760
The date-palm orchard, R. H. Forbes 761
Dates, A. J. McClatchie 761
Variety tests of strawberries, O. M. Taylor 761
Strawberries, A. J. McClatchie 761
New methods of grafting and budding vines, E. H. Twight 761
A study of grape pollen and what the results indicate, N. O. Booth 762
The management of greenhouses, E. Lonsdale 763
Mature *v.* immature lily bulbs, A. F. Woods 763
Statistics of horticultural products 763

FORESTRY.

Eucalypts, A. J. McClatchie 765
Spontaneous groups of seedlings, A. C. Forbes 765
The future of our public forest lands, F. Roth 765
Review of lumber trade and forest interests of the South, 1902, D. W. Baird 765
Forest conditions in southern Arizona, R. S. Kellogg 766
The forests of Rhode Island, F. W. Card 766
Forestry in Germany, J. E. Kehl 766
Forestry in Natal, J. S. Lister 766
Tree growing at high elevations in Ceylon 766
Blue gums as forest trees, C. H. McNaughton 766
Wood and cork, E. d'Hubert 767

SEEDS—WEEDS.

Page.

The influence of heat on the germination of seeds, H. H. Dixon 767
The germination of seeds after exposure to high temperatures, H. H. Dixon.. 767
Germination of leguminous seed and its influence by micro-organisms, L. Hiltner 768
The action of alcohol on germination of seeds, L. Sukatscheff 768
Resistance of seed to poisons, H. H. Dixon 768
California-grown sugar-beet seed 768
The Canada thistle and dandelion, L. H. Pammel 768
Charlock or yellow weed 768
Destruction of charlock in grain crops, G. F. Strawson 769
Notes on the destruction of some injurious plants, G. Heuzé 769

DISEASES OF PLANTS.

Miscellaneous notes on fungus diseases of plants, L. H. Pammel 769
Report of the vegetable pathologist and entomologist, H. Tryon 769
The origin and propagation of cereal rusts through the seed, J. Eriksson 770
The occurrence and distribution of cereal rusts through the seed, J. Eriksson.. 770
On the specialization of cereal rusts, J. Eriksson 770
The specialization of black rust of cereals, J. Eriksson 771
Cereal rusts, D. McAlpine 771
Wheat and barley rusts, D. McAlpine 771
Culture experiments with rust fungi, H. Klebahn 771
A classification of the rusts of the Umbelliferæ, C. B. Plowright 771
Rust of *Andropogon sorghum*, W. Busse 771
Rust of timothy, J. Eriksson 771
The relation between host and parasite, H. Marshall Ward 772
Concerning pure cultures of the rust *Puccinia dispersa*, H. Marshall Ward 772
Contribution to the study of cereal smuts and their prevention, C. von Tubeuf. 772
Experiments in the prevention of stinking smut of wheat, D. McAlpine 772
Some biological phenomena of *Ustilago maydis*, J. Grüss 772
A new parasite of *Trifolium montanum*, F. Bubak 773
The stem anthracnose of red clover, O. Kirchner 773
Urophlyctis, a fungus causing galls on the roots of alfalfa, P. Magnus 773
On the parasitism of *Pseudomonas destructans*, M. C. Potter 773
The root rot of taro, J. G. Smith 773
A disease of nursery stock, G. Massee 774
Two unusual troubles of apple foliage, F. C. Stewart and H. J. Eustace 774
Spraying experiments in 1902 for black spot, D. McAlpine 775
Experiments in the treatment of apple and pear scab, 1901–2, D. McAlpine... 775
Experiments in the treatment of black spot of the apple and pear, D. McAlpine 775
The fungus causing black spot of the apple and pear, D. McAlpine 775
Die-back of the apple, D. McAlpine 776
Brown rot or ripe rot of fruit, D. McAlpine 776
Peach and plum rust, D. McAlpine 776
Clasterosporium carpophilum and the gummosis of stone fruits, R. Aderhold... 776
Variations in the appendages of *Podosphæra oxyacanthæ*, J. G. Sanders 776
A disease of pineapples 776
Occurrence and characteristics of black rot in Dagestan, N. N. von Speschnew. 776
An experiment on the treatment of gray rot of grapes, F. Boisseau 776
Powdery mildew and early pruning, L. Ravaz 777
Powdery mildew and early pruning, L. Degrully 777
Recent investigations in combating the enemies of the grape, F. Gvozdenovic.. 777
Diseases of cultivated chrysanthemums, P. Voglino 777
Chlorosis in palms 777
Witches' brooms on the barberry, J. Eriksson 777
Larch and spruce fir canker, G. Massee 778
Some new fungus parasites of oaks, E. Henry 778
A twig blight of willows, C. von Tubeuf 778
Two new leaf parasites of deciduous trees, P. Hennings 778
Experiments in combating dry rot of timber, E. Henry 778
A contribution to the knowledge of timber dry rot, C. von Tubeuf 778
Spraying for fungus diseases, D. McAlpine 778

ENTOMOLOGY.

	Page.
Insects notably injurious in 1902, F. L. Washburn	779
Notes on injurious insects, G. Lüstner	779
Insects and their relation to agriculture, W. E. Britton	779
Some common insect pests of the farmer, H. T. Fernald	780
Economic entomology, H. Tryon	780
Economic entomology, C. Fuller	780
Insect epidemics	780
Notes on the Ixodidæ, L. G. Neumann	780
The berseem worm, G. Bonaparte	780
The melon plant louse and the "manteca" disease, J. J. Thornber	780
The codling moth and apple scab	780
Scale insects of the West Indies, H. Maxwell-Lefroy	780
Winter treatment and summer treatment of San José scale, J. Dearness et al	780
Lime, salt, and sulphur wash, J. B. Smith	781
The effect of carbon bisulphid upon scale insects, J. Moritz	781
The effect of hydrocyanic-acid gas on scale insects, J. Moritz	781
Instructions for the treatment of San José scale, W. M. Scott	781
The Indian wax scale as an orchard pest, W. W. Froggatt and W. J. Allen	781
The limitations of parasites in destruction of scale insects, W. W. Froggatt	782
The red spider of citrus trees, C. W. Woodworth	782
The orange bark weevil	782
The mosquito blight of tea, H. H. Mann	782
The coffee borer in Usambara, F. Stuhlmann	782
Experiments in infecting grasshoppers with the grasshopper fungus, Lommel	782
The guinea-grass moth	783
The "green page" moth (*Cydimon leilus*)	783
Methods of combating animals injurious to crops and fruits, G. del Guercio	783
Experiments to test effect of insecticides and fungicides on plants, J. Moritz	783
A list of North American Lepidoptera, H. G. Dyar	783
Origin of natural coloration of silk of Lepidoptera, D. Levrat and A. Conte	783
Observations on termites, or white ants, G. D. Haviland	784
Mosquito development and hibernation, J. W. Dupree and H. A. Morgan	784
On the Anopheles in the suburbs of Paris, Edmond and Étienne Sergent	784
A study of Anopheles on the Isthmus of Suez, Cambouliu	784
Bee keeping and the drought, A. Gale	784
Silk—its origin, culture, and manufacture	784
Statistics of bees, honey, and wax	784

FOODS—NUTRITION.

The baking quality of flour and its estimation, G. Hamann	784
Relation between protein content and baking quality, R. Reichert	785
Baking quality of flour and experiments with flour and gluten, H. Sellnick	785
Grain, flour, and bread, A. Maurizio	785
Experiments with flour and grain, A. Maurizio	786
The Artopton, H. Sellnick	786
Slimy bread, J. König	786
Fruits and fruit products, L. S. Munson, L. M. Tolman, and B. J. Howard	786
The manufacture of preserved foods and sweetmeats, A. Hausner	787
Preliminary report on the composition of cacao butter, J. Klimont	787
Milk powder in Germany, O. J. D. Hughes	787
New food materials, Rühle and J. König	787
Contribution to the chemistry of fatigue, H. W. Harper and M. Holliday	787
Metabolism of nitrogen, sulphur, and phosphorus in man, H. C. Sherman	788
Use of diet sufficient for maintenance but poor in protein, B. H. Jägerroos	788
Excretion of carbon dioxid and water by man through the skin, E. A. von Willebrand	788
Does the diet have an effect upon the excretion of carbon dioxid when muscular work is performed? J. E. Johansson and G. Koraen	789
The work of the digestive glands, J. P. Pawlow, trans. by W. H. Thompson	789
Pancreatic secretion, Bayliss and Starling	789
Utilization of glycerin in the body and its estimation in urine, H. Leo	789
Calculating the cost and nutritive value of army diet, Schumburg	789
General mess manual and cookbook for use on board vessels of the U. S. Navy	789
Home science cookbook, Mary J. Lincoln and Anna Barrows	789
International catalogue of scientific literature. Q—Physiology	790

ANIMAL PRODUCTION.

	Page.
Forage crops, R. H. Forbes and W. W. Skinner	790
Inspection of feeding stuffs, W. H. Jordan, C. G. Jenter, and F. D. Fuller	790
Licensed concentrated feeding stuffs, F. W. Woll and G. A. Olson	790
The origin of fat in the animal body, G. Rosenfeld	791
The rôle of salt in animal feeding, A. Dissard	791
The adipolytic ferment in the stomach, F. Volhard	791
Concerning the ferment in the mucous membrane of the pylorus, F. Klug	791
Influence of the spleen on the assimilation of nitrogen, I. Byelgooski	791
Feeding experiments in Seine-Inférieure in 1901, F. Laurent	791
Alfalfa *v.* sorghum for wintering calves, E. A. Burnett	792
Raising calves for beef production—skim milk *v.* sucking dam, E. A. Burnett	792
Raising calves with skim milk, C. H. Eckles	793
Wintering calves on roughness, E. A. Burnett and H. R. Smith	793
Results of calf-feeding tests at Kleinhof-Tapiau Experiment Station, Hittcher	793
Fattening steers, T. Shaw	794
Wheat *v.* corn in a ration for fattening steers, E. A. Burnett and H. R. Smith	795
Comparison of shelter and rations in feeding steers, E. A. Burnett	796
Dehorning fattening steers, G. H. True	796
Cattle, H. J. Monson	796
Fattening lambs, T. Shaw	796
Hand-feeding sheep, F. B. Guthrie	797
Hand-feeding stock in the Moree District, E. R. Scott	798
Hand-feeding sheep in times of drought, W. C. Dowling	798
Salt for sheep	798
The improvement of pasture as tested by sheep	798
Experiments on farming pasture at Waresley	798
Sheep-shearing test at Halle in 1901, C. Lehmann	799
Maltese goats, J. H. Grout	799
Wheat compared with other grains for pigs, H. R. Smith	799
Corn *v.* wheat for pigs on alfalfa pasture, E. A. Burnett and H. R. Smith	799
Egg-laying competition at Hawkesbury Agricultural College, D. S. Thompson	799
Statistics of farm animals	799

DAIRY FARMING—DAIRYING.

Feeding experiments with milch cows, 1900–1901, F. Friis	801
Feeding experiments with gluten feed, N. Ritland	802
Feeding experiments with corn-molasses feed for milch cows	802
The Hegelund method of milking, C. W. Aarhus	802
Milking according to Dr. Hegelund's method, L. Steen	802
On milking, with special reference to clean milking, K. W. Aaderman	802
Dairy herd record and creamery notes, R. W. Clark	802
The dairy herd, G. H. True	803
Feeding hay to cows on pasture, G. H. True	803
Report of the Milk Control Station in Christiania, Norway, 1901, H. Olsen	803
Report of the Milk Control Station, Trondhjem, Norway, 1901, T. Solberg	803
Report of the Milk Control Station, Bergen, Norway, 1901, K. Seielstad	803
The cause of ropy and slimy milk, J. Tillmans, J. König, and A. Spieckermann	803
Contribution to the study of the cause of slimy and ropy milk, T. Gruber	804
Milk powder, M. Ekenberg	804
The refractometer testing of butter and a new form of thermometer, E. Baier	804
Denmark's butter exports, 1901–2, B. Böggild	804
Swedish butter exhibits	804
Danish cooperative creameries during the past twenty years, B. Böggild	804
Trials with different systems of illumination for creameries, P. V. F. Petersen and K. S. Kristensen	804
Some of the compounds present in American Cheddar cheese, L. L. Van Slyke and E. B. Hart	805
Statistics of dairy cows and the dairy industry	805

VETERINARY SCIENCE AND PRACTICE.

Studies on the phenomenon of agglutination, C. Nicolle and M. Trenel	806
Agglutinating and sensibilizing properties of specific sera, A. Dubois	806
The effect of absorption upon the action of alexin, M. Wilde	806

Page.
The rôle of the membrane of bacteria in agglutination, W. Defalle 807
Effect and nature of secretions of a pathogenic organism, Charrin and Guillemonat 807
The differentiation of anaerobic bacilli, P. Achalme 807
The physiology of spore formation in bacilli, and notes on the growth of certain anaerobic bacteria, T. Matzuschita 807
Diagnosis of micro-organisms by specific serum reactions, O. Voges 808
Unknown infection material, E. Joest 808
Infection of animals by means of cutaneous inoculation, E. Fritsche 809
Acid-proof and alcohol-proof properties of *Streptothrix farcinica*, C. Feistmantel. 809
Accidents following upon vaccination, E. Leclainche and H. Vallee 809
Report of stock and brands branch, 1901, A. Salwey et al 809
Annual report of the imperial bacteriologist for 1901–02, A. Lingard 810
Annual report of the veterinary service for the year 1901 810
The relationship of human and bovine tuberculosis, J. D. Hamilton et al 810
The question of the identity of human and bovine tuberculosis, A. von Székely. 810
The British Congress on Tuberculosis, G. T. Brown 811
Tuberculosis in cattle with special reference to the virulence of the milk of tuberculous cows, E. J. McWeeney 811
The nature of the tuberculin reaction, K. Preisich and P. Heim 811
Bacilli which resemble those of tuberculosis and the bacilli of smegma, A. Weber 812
Combating tuberculosis in hogs by means of tuberculin tests, Thiro 813
Electrical resistance and refraction of tetanus toxin, Dongier and Lesage 813
The disappearance of anthrax bacilli in normal lungs, J. J. Snel 813
Immunization against anthrax with pyocyanase, K. Vaerst 814
Texas cattle fever and salt sick, C. F. Dawson 814
Texas fever, I, G. E. Nesom 815
Report upon Texas fever in Rhodesia, C. E. Gray and W. Robertson 815
Red water in Rhodesia, H. Watkins-Pitchford 815
Texas fever and rôle of buffaloes and zebus in hot, unhealthy regions, R. Marès. 816
Rinderpest in South Africa, D. Hutcheon 816
Blackleg and contagious abortion, D. F. Luckey 816
Foot-and-mouth disease, D. E. Salmon 816
Heart water in calves, C. P. Lounsbury 816
The plague of ticks; their destruction by oil spraying, C. P. Lounsbury 816
Cattle dipping tanks 817
Preventive treatment of sheep scab, F. J. Bosc 817
Report of the chief inspector of sheep for the year 1901, A. G. Davison 817
Glanders, S. B. Woollatt 817
Hygiene of domesticated animals, H. George 817
Distemper in dogs, C. Phisalix 817
Rabies or hydrophobia, W. Robertson 818
Rabies, S. B. Woollatt 818
Roup, F. C. Harrison 818
Fowl typhoid, C. Curtice 818
Vaccination against pasteurelloses, J. and M. Lignières 818
Preventive and curative serum for the pasteurelloses, Lignières and Spitz 819
Liver disease (tuberculosis) of poultry, A. Meek 819
Sorghum poisoning, H. Tryon 819
Grazing in orchards sprayed with poisonous washes 819
The bactericidal and disinfecting action of Lysoform, O. Seydewitz 819
The bactericidal action of soaps, D. Konradi 819

AGRICULTURAL ENGINEERING.

Irrigation, F. H. Newell 819
Problems in farming by irrigation, S. Avery 820
Irrigation on a Sussex farm 820
Irrigation on the Burdekin Delta 820
Prospect for irrigation on the Colorado River, F. H. Newell 820
Completion of the Nile dams, J. Ward 820
Water conservation, irrigation, and drainage in New South Wales, H. G. McKinney 820
A simple homemade water lift, A. H. Benson 820
Agricultural implements in France, R. P. Skinner 820
On official trials of farm machinery, F. Bokelman 820

Page.

Trials of agricultural machinery at Ultuna 820
On the application of electricity in agriculture, C. V. Birk 820
Technical machine testing station in Berlin 820
Equipment and processes employed in agricultural operations, A. Hidien 820
Granaries of the General Transportation Company of Paris, F. Main 821

MISCELLANEOUS.

Annual report of the director of Pennsylvania Station, H. P. Armsby..... 821
Statistics of agriculture 821
Cotton manufactures, E. Stanwood 822
Development and present condition of agriculture in Roumania, C. Jornescu. 822
Changes in agricultural management in Wurttemberg, F. Franck..... 822
Decreasing culture of grain in favor of stock raising, E. von Rechenberg..... 822
Determination of net profits in agriculture, L. Huschke..... 822
Nature study..... 822

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Alabama College Station: Page.
Bul. 121, Nov., 1902 802
Arizona Station:
Thirteenth An. Rpt., 1902 .. 754, 756, 761, 765, 780, 790, 796, 803, 821
California Station:
Bul. 145, Nov., 1902 782
Bul. 146, Nov., 1902 761
Florida Station:
Bul. 64, Oct., 1902 814
Hawaii Station:
Bul. 2 773
Indiana Station:
Fifteenth An. Rpt., 1902 821
Iowa Station:
Bul. 61, July, 1902 ..... 768, 769
Minnesota Station:
Bul. 75, May, 1902 796
Bul. 76, June, 1902 794
Bul. 77, Nov., 1902 779
Missouri Station:
Bul. 57, Apr., 1902 793
Nebraska Station:
Bul. 75, Nov. 6, 1902 ..... 792, 793, 795, 796, 799
New Jersey Stations:
Bul. 162, Oct. 23, 1902 781
Bul. 163, Oct. 29, 1902 749
New York State Station:
Bul. 217, Nov., 1902 790
Bul. 218, Nov., 1902 761

Stations in the United States—Continued.

New York State Station—Cont'd. Page.
Bul. 219, Dec., 1902 805
Bul. 220, Dec., 1902 774
New York Cornell Station:
Fifteenth An. Rpt., 1902 821
North Carolina Station:
Bul. 181, May, 1902 784
Pennsylvania Station:
Bul. 61, Oct., 1902 821
Rhode Island Station:
Bul. 87, Sept., 1902 818
Bul. 88, Oct., 1902 766
Bul. 89, Oct., 1902 750
South Carolina Station:
Bul. 72, June, 1902 815
Bul. 73, June, 1902 750
Fifteenth An. Rpt., 1902 821
Wisconsin Station:
Bul. 97, Dec., 1902 790

U. S. Department of Agriculture.

Bureau of Animal Industry:
Circ. 38 816
Bureau of Chemistry:
Bul. 66 786
Office of Experiment Stations:
Bull. 121 788
Division of Statistics:
Crop Reporter, vol. 4, Nos. 7–9, Nov., 1902–Jan., 1903 821

7. Missouri live-stock building—plan of second floor 735

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The Editor and H. W. Lawson.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. Beal.
Botany and Diseases of Plants—Walter H. Evans, Ph. D.
Foods and Animal Production—C. F. Langworthy, Ph. D.
Field Crops—J. I. Schulte.
Entomology and Veterinary Science—E. V. Wilcox, Ph. D.
Horticulture—C. B. Smith.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 9.

Editorial notes:	Page.
Need of experiments with horses	829
An index catalogue for agricultural libraries	830
An index of scientific periodicals	831
Memoir of the National Institute of Agriculture at Paris	832
Recent work in agricultural science	833
Notes	930

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

Colorimetric determination of phosphoric acid and silica, F. P. Veitch	833
Determination of citric-soluble phosphoric acid in Thomas slag, H. Neubauer	834
Determination of phosphoric acid in Thomas slag, O. Kellner and O. Böttcher	834
Chemical analysis of soils, R. Corradi	834
A chemical method for determining the quality of limestones, A. M. Peter	834
Determination of carbon dioxid by the Walker method, A. G. Woodman	834
Oxidation of organic nitrogen compounds and estimation of carbon and nitrogen therein by the moist process, E. Van Aken	835
Determination of constants for use in hydrographic tables, M. Knudsen et al	835
Impurities in oxygen and combustion in the bomb calorimeter, M. Berthelot	835
Determination and distribution of pentosans in Sea Island cotton, F. S. Shiver	835
Solutions for testing cream and milk, J. B. Weems and C. E. Gray	836
On the determination of moisture in honey, F. T. Shutt and A. T. Charron	836
Some notes concerning Halphen's test for cotton-seed oil, E. Fulmer	836
Determination of stearic acid, H. Kreis and A. Hafner	837
Examination and composition of lemon juice, K. Farnsteiner	837
The identification and composition of malt liquors, C. L. Parsons	837
The standardization of sulphuric acid, F. S. Shiver	837
Liquid baths for melting point determinations, H. Scudder	837
The prevention of bumping, H. Scudder	837
A water jacket of constant ordinary temperature, J. C. Schalkwijk	837
A new form of Kjeldahl apparatus	837

Page

Report of the senior analyst of Cape of Good Hope for 1901, C. F. Juritz 837
Chemical division, New Zealand Department of Agriculture, B. C. Aston 837
Handbook of inorganic chemistry, O. Dammer 838
Results of agricultural chemistry, A. Mayer 838
Agricultural chemistry, I. Giglioli 838
Annual report of progress in animal chemistry, R. Andreasch and K. Spiro .. 838

BOTANY.

Relation of the water content of the soil to certain plants, G. G. Hedgcock 838
Influence of the awns of grasses, S. Treyakov 839
Influence of fluctuation of temperature on respiration of seeds, Karchevski ... 839
Influence of light on respiration of some of the lower fungi, N. A. Maximow . 839
Investigations on the respiration of plants, B. Plovtzev 840
Irritability of stigmas toward foreign pollen, W. Burck 840
The necessity of lime for seedlings, L. von Portheim 840
The solvent power of plants for mineral phosphates 840
The physiological rôle of nicotin in the tobacco plant, G. Albo 841
The biology of asexual reproduction of flowering plants, A. Terracciano 841
Root tubercles of *Datisca cannabina*, A. Trotter 841
Green hemiparasites, E. Heinricher 841
The seed fungus of the darnel, E. M. Freeman 842

ZOOLOGY.

Judging the benefits and injuries by insectivorous birds, K. Eckstein 842
Birds and insects in relation to agriculture, E. H. Forbush 842
Partial bibliography of economic relations of North American birds, C. M. Weed 842
Measures to be adopted for bird protection in Egypt, W. I. Bey 842
Birds of New Zealand, D. V. Lucas 842
Destroying sparrows 842
Woodpeckers 843
The quest of rabbit extermination and the question of disease 843
The plague of rats, T. Skschivan 843
A bacillus pathogenic for the house rat, C. Toyama 843
Mouse and rat plague, E. Wiener 843
Infection with Trypanosoma, T. von Wasielewski 843
Annual report of the South Australian Zoological and Acclimatization Society . 843
Phytopathological observations near Hamburg, L. Reh 843
Zoological record, D. Sharp 844
Index zoologicus, C. O. Waterhouse 844
Index-catalogue of medical and veterinary zoology, C. W. Stiles and A. Hassall . 844
Guide for collecting, preserving, and packing animals for the zoological museum in Berlin, Möbius 844
Game laws for 1902, T. S. Palmer and H. W. Olds 844

METEOROLOGY.

Monthly Weather Review, Vol. XXX, Nos. 10–12 844
Some peculiarities in frost formation over the coast region of South Carolina, L. N. Jesunofsky 845
Cycles of precipitation, L. H. Murdoch 845
Meteorology, J. B. Harrison 845
The climatology of Africa, E. G. Ravenstein et al 846
Rainfall and temperature at Pretoria, J. L. Soutter 846
Meteorological report of the State of Florida for 1901, A. J. Mitchell 846
Meteorological observations, W. B. Alwood 846
Meteorological observations on Ben Nevis, A. Buchan et al 846
Meteorological observations at the experiment station of Breslau, B. Schulze . 846
Seasonal variation of the atmospheric temperature of the British Isles and its relation to wind direction, W. N. Shaw and R. W. Cohen 846
Effect of sea temperature upon the seasonal variation of air temperature of the British Isles, W. N. Shaw 846
Temperature of atmosphere and causes of glacial periods, H. N. Dickson 847
Systematic exploration of atmosphere at sea by means of kites, A. L. Rotch .. 847

Page.
Recurrence of rain—the relation between the moon's motion in declination and the quantity of rain in New South Wales, H. C. Russell 847
Instructions for obtaining and tabulating records from recording instruments, C. F. Marvin 847
On the inverse relation of chlorin to rainfall, W. Ackroyd 847
Weather maps, W. N. Shaw 847
International catalogue of scientific literature. F—Meteorology 847

WATER—SOILS.

Contributions from testing station for water supply and sewage disposal of Berlin, A. Schmidtmann and C. Günther 847
Purification of drinking water by distillation, G. Coupan 847
Artesian water in the State of Queensland, Australia, R. L. Jack 847
Movements of underground waters of Northwest Yorkshire, W. W. Watts et al. 847
On the distribution of chlorin in Yorkshire, II, W. Ackroyd 848
On the circulation of salt and its geological bearings, W. Ackroyd 848
Supply of sodium and chlorin by the rivers to the sea, E. Dubois 848
On the diffusion of water in humus soils, E. Blanck 848
The soils of Dominica, F. Watts 848
Geology regarded in its economic application to agriculture, J. R. Kilroe 849
The source of nitrogen in forest soil, R. G. Zon 849
The natural improvement of soils, E. B. Voorhees 849
Studies on distribution of lime in soils of vineyards, J. Dufour and H. Faes .. 849
A contribution to the chemical study of peat soils, G. Ongaro 849
On the treatment of moor soils, G. Grotenfelt 849
Occurrence of phosphatic nodules and phosphate-bearing rock, J. Rhodes 849
A case for soil investigations, R. Thiele 849

FERTILIZERS.

Peat soil as a soil amendment, H. von Feilitzen 849
Ammoniacal and nitric nitrogen, S. Hals 850
Utilization of atmospheric nitrogen by agricultural plants, M. Gerlach 850
Notes on nitrification organisms, W. Omelianski 850
Are there bacteria which assimilate free nitrogen? A. A. Bonnema 850
The nitrogen content of the seed of lupines used as fertilizer, N. Passerini 850
The preservation of barnyard manure, T. Pfeiffer 850
Compost heap and its management, M. Saul 850
On the utilization of night soil in European cities, J. Sebelien 850
On experiments with manure and artificial fertilizers, O. Omre 851
On the manuring of the soil in Algiers and Tunis, G. Ryf 851
Organization of local fertilizer experiments in European countries, A. Rindell. 851
The supplying of the phosphoric acid requirements of plants, P. Wagner 851
On the question of rendering phosphorite soluble, I. Schulov 851
Algiers phosphate against Thomas phosphate, A. Ystgaard 851
Pot experiments with fertilizers, B. Schulze 851
Fertilizer experiments with kainit and 40 per cent potash salt, B. Schulze 851
Irrigation and fertilizing on domain of Grafenwerth on the Rhine, R. Schroer. 852
Fertilizer department, B. E. McLin and R. E. Rose 852
Report on enforcement of Missouri fertilizer-control law, H. J. Waters 852

FIELD CROPS.

Field experiments at Lauchstädt, W. Schneidewind, D. Meyer, and W. Gröbler. 852
Fertilizer experiments on meadows, Edler 854
Kainit and 40 per cent potash salt as fertilizers for cereals, H. Bachmann 854
Variety tests of barley and oats, C. Fruwirth 854
Studies of Bohemian varieties of barley, O. Kamberský 854
Bermuda grass, J. Fields 855
Bermuda grass, J. S. Newman 855
Improvement of red clover, M. Fischer 855
Corn culture, R. J. Redding 855
Methods of corn breeding, C. G. Hopkins 855
Cotton, A. Oppel 855
Experiments with hemp, V. V. Viner 856

Page
Novel system of potato production 856
Rape as a forage crop, A. S. Hitchcock 856
Culture and composition of rice, G. d'Utra 856
Root crops in Montana, R. S. Shaw 856
Sugar beets, F. W. Traphagen 856
Sugar-beet speculation, A. B. Leckenby and R. Withycombe 856
Late growth of sugar beets, A. G. Doyarenko 857
Experiments with sugar cane, J. B. Harrison 857
Sugar-cane culture 858
Fertilizer experiments with tobacco in Deli, D. J. Hissink 858
Agricultural botanical report for 1901, J. Eriksson 858

HORTICULTURE.

Vegetable gardening in the mountain glades, L. C. Corbett and K. C. Davis 858
Garden vegetables, O. M. Morris 859
Effect of acetylene gaslight on plant growth, F. W. Rane 860
The utilization of mineral matter by grafted plants, L. Daniel and V. Thomas 860
Radishes, parsnips, carrots, and salsify, E. S. Brown 860
Cabbages and cauliflowers 860
Celery, E. S. Brown 860
The Dutch brined vegetable industry, R. F. Crawford 860
Vegetables containing iron, H. Kühl 861
Tests of table beets and mangel-wurzels, E. S. Brown 861
An experiment in ginseng culture, G. C. Butz 861
Ginseng; its cultivation, harvesting, marketing, etc., M. G. Kains 862
Notes from the trial grounds, E. S. Brown 862
Practical suggestions for fruit growers, H. P. Gould 862
Peach growing in West Virginia, K. C. Davis 862
The coloring matter and sugar of apricots, A. Desmoulière 863
Culture of the citrus in California, B. M. Lelong et al 863
The new method of curing lemons 863
Limes at Dominica 863
The formation of acid in lemons, E. Leuscher 863
Olive oil tests, W. J. Allen 863
The banana, Cazard 864
Pineapple culture, I, A. H. Benson 864
Pineapples, cultivation, C. E. Smith 864
The mango in Porto Rico, G. N. Collins 864
The kumquats, H. H. Hume 864
Winter treatment of orchards, F. W. Faurot and J. T. Stinson 865
Catalogue of fruits growing on the experimental grounds of Iowa Station 865
Report of the fruit expert, W. J. Allen 865
Horticulture in Norway, 1660–1814, S. Skappel 865
Fruit and vegetable storage and shipment experiments, W. A. Taylor 865
Cold-storage investigations by U. S. Department of Agriculture, G. H. Powell 865
Cold storage of fruit, J. B. Reynolds and H. L. Hutt 866
Commercial fruit evaporators, J. C. Whitten and L. A. Goodman 866
Directions for picking, storing, and uses of fruit, C. Matthiesen 867
Science and experiment as applied to canning, O. L. Deming 867
Maine canning industry, B. M. Fernald 867
Culture of coffee, fertilizer experiments, G. d'Utra and R. Bolliger 867
Cacao 867
Experiments in manuring strawberries, E. Marre 867
Chemical composition of wood strawberry (*Fragaria vesca*), G. Paris 868
The grape in Kansas, W. H. Barnes 868
The application of chemical fertilizers in the culture of grapes on the calcareous soils of Charente, J. M. Guillon and G. Gouirand 868
Experiments with Trifoliata in Texas, H. M. Stringfellow 868
The effect of winter freezes on grapes, A. Bonnet 868
Grafting green grapevines, J. Zawodny 868
The rooting of berlandieri solved, E. Jachet 868
The ringing or annular incision of vines, A. J. Perkins 869
New investigations on the resistance to phylloxera, L. Ravaz 869
Potency of the pollen of self-sterile grapes, S. A. Beach 869
Influence on self-fertility of girdling or bending the canes, S. A. Beach 869
Spanish almonds and their introduction into America, D. G. Fairchild 870

Page.
Plant propagation, W. L. Howard 870
Outline of greenhouse laboratory work, S. B. Green and R. S. Mackintosh ... 870
Distribution of seeds and plants, E. J. Wickson 870
Tropical plants of commercial importance, E. de Wildeman 870
Studies on some essences of the French colonies, E. Charabot 871
Forcing lilacs, J. Villebenoist 871
Ether and chloroform in forcing 871
Roses for English gardens, Gertrude Jekyll and E. Mawley 871
Gardens old and new—the country house and its garden environment 871

FORESTRY.

Relation of forestry to public health, W. H. Brewer 871
Relation of forestry to the farmer, H. C. Price 871
Outlook of the timber supply in the United States, B. E. Fernow 871
New forest reserves 872
Natural reproduction in the Adirondack forests, A. Knechtel 872
The forests of Maine, E. E. Ring 872
Annual report of the forest administration in South Australia, W. Gill 872
Forest administration of Central Provinces, A. Smythies and J. A. McKee ... 872
Report on forest administration in Lower Provinces of Bengal, A. E. Wild ... 872
A hardy American forest tree, J. P. Brown 873
The Norway spruce in Iowa, L. H. Pammel 873
Trees for shade, ornament, and roadside planting, W. R. Lazenby 873
How to grow a forest from seed, F. W. Rane 873
Collecting jack-pine seed, E. A. Sterling 874
A new method of turpentine orcharding, G. Pinchot 874
The distribution of plants in forest regions, W. M. Munson 874
Trees and shrubs as sand binders, K. Sajo 874
The fixation of shifting sands, J. Gifford 874
Instruction in forestry in Switzerland, A. K. Myhrvold 874

SEEDS—WEEDS.

The principles of plant production; the seed, F. B. Mumford 874
The effect of alcohol on the germination of some seeds, L. Sukatscheff 874
Protein bodies of various oil-bearing seeds, B. Gram 874
Some frauds in the seed trade, D. Vidal 875
Report of Göteborg and Bohus Seed Control Station, 1902, J. E. Alén 875
Report of the Seed Control Station, Christiania, 1901, Anna Steen 875
The seeds of rescue grass and chess, F. H. Hillman 875
The Canada thistle, S. Lund and E. Rostrup 875

DISEASES OF PLANTS.

Potato spraying in 1902, F. C. Stewart, H. J. Eustace, and F. A. Sirrine 875
Notes on the bacterial disease of potato, G. Battanchon 876
Sugar cane diseases, J. B. Harrison 876
Contributions from the bacteriological laboratory, New South Wales, R. G. Smith 876
A form of corn smut, G. Mottareale 877
Influence of time of sowing on occurrence of loose smut of oats, F. K. Ravn .. 877
Oat smut and its prevention, C. D. Woods 877
Uredineous infection experiments in 1902, W. A. Kellerman 877
A rice disease, T. Kawakami 877
A nematode disease of rice, J. van Breda de Haan 877
Relation between species of Pleospora and Helminthosporium, H. Diedicke .. 877
Effect of mineral starvation on parasitism of *Puccinia disperza*, H. M. Ward .. 878
The club root of cabbage, L. Mangin 878
Studies on *Plasmodiophora brassicæ*, Feinberg 878
Bacillus subtilis and *B. vulgatus* as plant parasites, C. J. J. van Hall 878
Asparagus rust, J. Isaac 879
A mushroom disease, G. T. Malthouse 879
Susceptibility of apples to scab and relation of weather to same, R. Aderhold . 879
The leaf-curl disease of the peach and its treatment, W. M. Scott 879
The pear blight in California, J. Isaac 879
Studies on plum blight, L. R. Jones 880

Page.
The root knot of plum, prune, and peach trees, J. Isaac 880
The silver leaf disease, J. Percival 880
The olive knot in California, J. Isaac 881
The fumagin of olives, E. Zacharewicz 881
Concerning the gooseberry mildew, P. Magnus 881
The gooseberry mildew in Russia, P. Hennings 881
Oidium and early pruning, G. Darragon 881
Report on a trip to Jamaica, F. S. Earle 881
Fungus cultures in the tropics, C. Holtermann 883
Comparative investigations of certain germicides, G. Wesenburg 883
The copper content of fungicides and the copper poisoning of soils, K. Sajo 883
Plant pathology, E. Rostrup 883

ENTOMOLOGY.

Insects of the year 883
Horticultural quarantine reports, A. Craw 884
Proceedings of the Entomological Society of Washington 884
Report on injurious insects in Finland for the year 1901, E. Reuter 884
Report of the State entomologist for 1901, S. Lampa 885
Report of work of section of plant protection, Hamburg, 1901–2, C. Brick 885
Notes on certain injurious insects, A. Hempel 885
The changa, or mole cricket, in Porto Rico, O. W. Barrett 885
Army worms on millet, G. d'Utra 886
Methods of controlling the boll weevil, W. D. Hunter 886
Potato insecticides and fungicides in 1902, C. D. Woods 886
Insects injurious to Cucurbitaceous plants, H. A. Surface 886
Some garden pests, W. W. Froggatt 887
Combating the enemies of asparagus, K. Sajo 887
Codling moth, R. A. Cooley 887
Codling moth, K. Sajo 887
Biological investigations of the nun (*Lymantria monacha*), S. Bengtsson 887
The brown-tail moth in Massachusetts, A. H. Kirkland 887
The wooly aphis on the roots of apple trees, C. Ritter 887
The mango shield scale 887
Distinctive characteristics of the species of the genus Lecanium, W. C. Thro. 887
The development of the cherry fly, K. Sajo 888
The frit fly (*Oscinis frit*) 888
The grape root worm, M. V. Slingerland and J. Craig 888
Tortrix pilleriana, J. Dufour 888
Insects affecting forest trees, H. Osborn 888
On the ravages of the spruce spinner (*Bombyx pini*), W. M. Schöyen 888
The biology of red spiders, R. von Hanstein 888
Notes on a Phytoptus, A. Kempel 889
Combating injurious insects by means of their natural enemies, K. Sajo 889
Spray calendar, W. E. Britton and G. P. Clinton 889
Spray calendar, N. O. Booth 889
Spray calendar, W. Lochhead 889
On the choice of a soft soap for hop spraying, C. Duncan 889
Analyses of Paris green, etc., L. L. Van Slyke and W. H. Andrews 889
Hypoderma bovis, F. Etchegoyhen 889
Sheep gadfly 889
Injurious household insects, S. Lampa 889
Remedies for fleas, A. F. Conradi 890
Mosquitoes in Algiers, Edmond and Étienne Sergent 890
Forest mosquitoes and forest malaria, A. Lutz 890
Description of a new Anopheles, C. S. Ludlow 890
Combating Anopheles, D. Rivas 890
Report on Texas College apiary, F. W. Mally and W. Newell 890
Annual report of the Royal Sericultural Station at Padua, 1901 890
Experiments at the Sericultural Station of Murcia for 1902, E. Lopez 891
Rearing and killing silkworms, E. Lopez 891
The silkworm in Spain, A. E. Carleton 891
Silkworms in Italy, W. Jarvis 891

FOODS—NUTRITION.

Food adulteration, F. W. Traphagen 891
Food adulteration, E. F. Ladd 892

Page.
Cereal breakfast foods, A. McGill 892
Estimating the value of wheat and wheat flour by means of baking experiments, K. Komers and E. von Haunalter 892
Examination of artificially colored barley grits, E. Kramer 893
Desiccated meat, F. B. Guthrie 893
Examination of meat juice, R. Vogel 893
Identification of horse flesh by means of a specific serum, G. Gröning 893
On certain exotic Graminæ used as food, Balland 894
Lime juice and catsup, A. McGill 894
Unfermented grape juice, T. Macfarlane 894
Chemical composition of food preservatives, J. B. Weems and I. J. Mead 894
Preservatives and coloring matters in food, C. E. Cassal 894
Chemical studies of paprika, W. Szigeti 894
Concerning organic compounds of sulphurous acid in foods, W. Kerp 894
Investigations on the nutrition of man in the United States, P. O. Smolenski 894
The dietary of families of Danish laborers, M. Rubin 894
Filipino ration, emergency ration, etc., J. F. Weston 894
What one eats in the Philippines, A. W. Greeley 895
Alcohol and muscular energy, L. Schnyder 895
A physiological study of nucleic acid, L. B. Mendel et al 895
Notes on the "protagon" of the brain, W. W. Lesem and W. J. Gies 895
Camp fires in the wilderness, E. W. Burt 895
How I live without cooking, W. T. Larned 895
Yeast and its household use, F. C. Harrison 896

ANIMAL PRODUCTION.

The principles of animal nutrition, H. P. Armsby 896
The exact calculation of balanced rations, J. T. Willard 897
Stock raising 897
Estimation of starch and digestibility of carbohydrates, S. Weiser, A. Zaitschek 897
Corn as a stock food, H. J. Waters 898
Some lessons from cattle-feeding experiments, F. B. Mumford 899
Environment and heredity, two great factors in cattle breeding, B. Gabbert 899
Concerning the metabolism of ruminants, J. Huth 899
Sheep feeding in Montana, R. S. Shaw 899
Influence of various manures on the production of mutton, W. Ashcroft 899
Thrift, the great essential in sheep feeding, J. Ziegler 899
Pork production in Montana, R. S. Shaw 900
Effect of time of drinking water on the digestibility of feed, F. Tangl 900
The metabolism of inorganic material by horses, F. Tangl 900
Experiments with poultry, O. M. Watson 901
Poultry experiments, J. H. Stewart and H. Atwood 902
Commercial feeding stuffs in the Connecticut market, E. H. Jenkins et al 904
Slaughtering and meat packing, H. C. McCarty 904
Wool manufactures, W. J. Battison 904

DAIRY FARMING—DAIRYING.

Experiments with dairy herd, A. L. Haecker 904
Feeding the dairy cow, C. H. Eckles 905
Butter record of the Buckhold herd, H. Watny 905
Milking and butter test trials, E. Mathews 905
The influence of feeding on the composition of the fat of milk, B. Sjollema 905
On the composition of cows' milk, H. C. Sherman 905
Pasteurization of milk in bottles with agitation, N. Gerber and P. Wieske 906
Tests of different methods of distinguishing raw and heated milk, G. Mullie 906
The hygienic differentiation of market milk and its derivatives by biological methods, V. Sion and N. Laptes 907
Milk, H. de Rothschild 907
The bacterial flora of freshly drawn milk, F. C. Harrison and M. Cumming 907
Improved method of studying milk bacteria, H. W. Conn and W. M. Esten 907
The percentage of water in Canadian creamery butter, F. T. Shutt 908
Control of rusty spot in cheese factories, H. A. Harding and G. A. Smith 908
Ripening of cheese in cold storage compared with ripening in the ordinary curing room, H. H. Dean, F. C. Harrison, and R. Harcourt 909
Plans and specifications of a cool cheese curing room, J. A. Ruddick 910
Fourth report of the California State Dairy Bureau, 1900–1902 910
Dairying division, J. A. Kinsella 910

VETERINARY SCIENCE AND PRACTICE.

Page.
The microbic diseases of animals, E. Nocard and E. Leclainche 910
Manual of veterinary medicine, E. Courtenay 910
Outlines of veterinary hygiene for veterinarians and students, F. Niemann and O. Profé 910
Practical veterinary advice for stock owners, A. H. Archer 910
Treatise on surgical therapeutics of domestic animals, P. J. Cadiot and J. Almy. 911
Manual of bacteriology, R. Muir and J. Ritchie 911
Report on investigations in the field of veterinary medicine, Ellenberger et al. 911
Veterinary science and its problems, O. Malm 911
Disinfection and disinfectants, M. J. Rosenau 911
Text-book of meat hygiene, R. Endelmann 911
Meat inspection in public abattoirs, G. Barrier 911
Serum agglutination and its value in meat inspection, H. Miessner and Herbst. 912
Results of strict sanitary regulations in Arizona, J. C. Norton 912
Report of State veterinarian of Washington for 1901 and 1902, S. B. Nelson.. 912
Thirteenth annual report of the veterinary service in Hungary, F. Hutyra... 912
Report of civil veterinary department and Bengal Veterinary College, 1901–2.. 912
Report of the chief inspector of stocks and brands, C. J. Valentine 913
The toxic substances in normal sera, Carré and Valée 913
The antiseptic value of Crede's colloidal silver preparation, E. Cohn 913
The bactericide power of fluorid of silver, H. Kerez 913
Decomposition of iodid of potash in the organism by means of nitrites, A. Stekanow 913
The action of lecithin on the leucocytes, H. Stassano and F. Billon 913
The permeability of the placenta for micro-organisms, N. K. Neëlow 914
Investigations on a new pathogenic species of yeast, E. Cohn 914
A bacterium resembling that of bubonic plague, E. Klein 914
A bacillus liable to be mistaken for the bacillus of tetanus, F. F. Bushnell... 914
Absorption of tetanus toxin, A. Marie and V. Morax 914
Bacillus coli communis from domestic animals, V. A. Moore and F. R. Wright. 914
The present aspect of tuberculosis problem in the United States, S. A. Knopf. 915
Recent investigations on relation of human and bovine tuberculosis, D. E. Salmon 915
The intertransmissibility of human and bovine tuberculosis, R. R. Dinwiddie. 915
Measures for prevention of tuberculosis in New York City, H. M. Biggs 915
Transmission of bovine tuberculosis to man by accidental inoculation, and the experimental reinoculation of calves, Spronck and Hoefnagel 915
Tubercular peritonitis in early life, T. M. Rotch 915
Ohio combating tuberculosis, J. C. Burneson 915
Tuberculosis in the suprarenal glands in cattle, A. M. Bergman 916
Statistics on tuberculosis in hogs, N. Zelenin 916
Tuberculosis of the udder in a mare, C. Parascandolo and V. de Meis 916
Tuberculin, H. F. Palmer 916
Actinomycosis of cattle, I. I. Shukevich 916
Actinomycosis from a bacteriological standpoint, W. Silberschmidt 916
Experimental researches on the variability of *Bacillus anthracis*, H. Martel... 916
The influence of the tanning process upon anthrax spores, H. Kessler 917
Preventive vaccination for anthrax in Yaroslav, A. V. Dedyulin 917
Cooperation in the control of epizootics of anthrax, W. H. Dalrymple 917
Preventive vaccination for anthrax in Novoladozh region, I. O. Gordzyalkovski. 917
Experimental researches on blackleg, E. Leclainche and H. Valée 917
Vaccination for blackleg by means of the thread vaccine, H. George 918
The preparation of blackleg vaccine, C. F. Dawson 918
Bovine pasteurellon in the Malay Peninsula, Carrongean 918
"Peste," C. Nockolds 918
Texas fever and its relation to live-stock interests of Tennessee, W. C. Rayen. 918
Some notes on redwater, J. Hewson 918
Rhodesian redwater, F. Hutchinson and P. D. Simmons 918
The Rhodesia form of redwater, H. Watkins-Pitchford 918
Oil-water pumps for spraying cattle to destroy ticks, C. P. Lounsbury 918
Treatment of foot-and-mouth disease with corrosive sublimate 919
Prevention of foot-and-mouth disease, Loeffler 919
External ulcerative ano-vulvitis of cattle. Preliminary report, J. J. Repp 919
External ulcerative ano-vulvitis, S. T. Miller 919
Hemorrhagic septicemia, M. H. Reynolds 919
Diseases incidental to pregnancy and parturition in the cow, A. M. Crichton. 920

Page.
Deviation from orthodox method of treating parturient paresis, W. E. A. Wyman 920
Parturient paralysis prior to parturition, J. J. Repp 920
Success in the treatment of parturient paresis, W. N. Babcock 920
On air treatment of milk fever, K. W. Aakerman 920
Abortion in cows, W. S. Phillips 920
Further experiments on the preventive treatment of contagious abortion 920
Barrenness of bovines, C. Schmitt 920
Note on cirrhosis of the liver in horses and cattle, J. A. Gilruth 920
Poisoning of cattle by sorghum and Kafir corn, A. T. Peters and S. Avery 921
Prussic acid in sorghum, H. B. Slade 921
Phytolacca poison in cattle, G. R. White 921
Mortality amongst cattle in Northeastern District, Australia, W. T. Kendall 921
Diseases of sheep, R. A. Craig and A. W. Bitting 921
An experience with nodule disease of sheep, M. H. Reynolds 921
Anthracoid, septic, or blood poisoning diseases of sheep, W. G. Dowling 922
Common colics of the horse, H. C. Reeks 922
Equine tropical diseases, particularly ulcerative lymphangitis, C. Nockolds 922
Pneumonia in the horse: Its etiology, J. A. W. Dollar 922
Pneumonia and its treatment, J. D. Fair 922
The pathogenesis of equine pneumonic emphysema, A. H. Baker 922
Acute nephritis in horses and dogs, M. P. Rukhlyadev 922
Traumatic peritonitis, with symptoms of anthrax, A. S. Zhirnov 923
Glanders, W. Hunting 923
Communicability of glanders and the action of mallein, A. C. Cope et al 923
Persistence of virulence of glanders bacilli on artificial media, I. Shantuir 923
Inoculation of frogs with glanders, I. Shantuir 923
Differential diagnosis between bursatee, furunculus, and farcy, C. C. Lyford 923
Epizootic abortion in mares, J. Guillerey 924
Nagana and mal de caderas as two distinct diseases, A. Laveran and F. Mesnil 924
Treatment and prevention of nagana, A. Laveran and F. Mesnil 924
Statistics as to the color of surra victims, C. Nockolds 924
The tsetse fly and the surra disease in German East Africa, F. Stuhlmann 924
The occurrence of *Glossina tabaniformis* in Dar-es-Salaam, F. Stuhlmann 924
Notes on feeding experiment to produce leucoencephalitis in a horse, T. Butler 925
The duration of the presence of the plague organism when injected into the veins of the horse, Carougeau 925
Cattle plague in camels, Chegis 925
Canine distemper, F. T. G. Hobday 925
Rabies and dog distemper, Beck 925
Fowl sickness, J. F. Marshall 925
Trichophytosis, J. B. Kessler 925
Mange, S. B. Woollatt 925
A note on various pasteurelloses observed in Turkey, M. Nicolle 926
Animal parasites, A. A. Brown 926

AGRICULTURAL ENGINEERING.

Engineering for land drainage, C. G. Elliott 926
Irrigation institutions, E. Mead 926
Hydrography 926
Water storage on Salt River, Arizona, A. P. Davis 926
Water resources of the State of Colorado, A. L. Fellows 927
Report of progress of stream measurements for 1901, F. H. Newell 927
Observations on flow of rivers in the vicinity of New York City, H. A. Pressey 927
Colonization and irrigation in Uganda and British East Africa Protectorate 927
Irrigating pumping plant, A. W. Clapp 927
The limit of use of hand pumps, M. Ringelmann 927
Apparatus for removing leaves, etc., from a water supply, Earl of Rosse 927
Trials of agricultural machinery at Weihenstephan, H. Puchner 927
The Danish trials of agricultural machinery, E. Jörgensen 927
The machine-testing station at Paris, M. Ringelmann 928
History of the development of the plow during 5,000 years, A. Laacke 928
Practical experience in the use of grain-seeding machines, Trübenbach 928
Exhibit of mowers and reapers at Hasselt in 1901, J. Pyro 928
Historic highways of America, A. B. Hulbert 928
Proceedings of the North Carolina Good Roads Convention, 1902, J. A. Holmes 928
Ninth annual report of the commissioner of public roads, H. I. Budd 928
The protection of buildings from lightning, K. Hedges 928

MISCELLANEOUS.

	Page.
The agricultural experiment station of Porto Rico, F. D. Gardner	929
Organization lists of the agricultural colleges and experiment stations	929
Experiment Station Work, XXI	929
Reports of the farmers' institutes, etc., of Manitoba for 1901 and 1902	929
Annual agricultural statistics of France, 1901	929
Austrian field crop statistics for 1902	929
Norwegian agriculture during recent years, J. Smitt	929
Agriculture of the native Javanese, H. C. H. de Bie	929
Agricultural education in Cape Colony	929
Accessions to the Library of the U. S. Department of Agriculture, 1902	929

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

	Page.
Alabama College Station:	
Fifteenth An. Rpt., 1902	928
California Station:	
Seed Bul., 1902–3	870
Connecticut State Station:	
Bul. 141, Jan., 1903	904
Bul. 142, 1903	889
Florida Station:	
Bul. 65, Dec., 1902	864
Georgia Station:	
Bul. 58, Dec., 1902	855
Illinois Station:	
Bul. 82, Dec., 1902	855
Indiana Station:	
Bul. 94, Feb., 1903	921
Iowa Station:	
Bul. 67, Nov., 1902	836, 894
Spec. Bul., Feb., 1903	865
Kansas Station:	
Bul. 115, Dec., 1902	897
Maine Station:	
Bul. 87, Dec., 1902	877, 880
Minnesota Station:	
Class Bul. 12	870
Missouri Station:	
Bul. 58, July, 1902	905
Circ. of Information 10, Mar. 15, 1902	889
Circ. of Information 11, Mar., 1902	898
Circ. of Information 13, Nov. 5, 1902	870
Circ. of Information 14	866
Circ. of Information 15, Jan., 1903	874
Circ. of Information 16, Dec. 31, 1902	852
Missouri Fruit Station:	
Bul. 4, Sept., 1902	865
Biennial Rpt., 1901–2	929
Montana Station:	
Bul. 37, Sept., 1902	900
Bul. 38, Oct. 1, 1902	891
Bul. 39, Nov., 1902	899
Bul. 40, Nov., 1902	856
Bul. 41, Dec., 1902	856
Montana Station—Continued.	
Bul. 42, Dec., 1902	887
Nebraska Station:	
Bul. 76, Jan. 24, 1903	904
Bul. 77, Jan. 26, 1903	921
Nevada Station:	
An. Rpt., 1902	929
New Hampshire Station:	
Bul. 94, Oct., 1902	890
Bul. 95, Nov., 1902	873
Tech. Bul. 4, Oct., 1902	860
Tech. Bul. 5, 1902	842
New Mexico Station:	
Thirteenth An. Rpt., 1902	929
New York State Station:	
Bul. 221, Dec., 1902	875, 876
Bul. 222, Dec., 1902	889
Bul. 223, Dec., 1902	869
Bul. 224, Dec., 1902	870
Bul. 225, Dec., 1902	908
New York Cornell Station:	
Bul. 208, Dec., 1902	888
Bul. 209, Jan., 1903	887
North Dakota Station:	
Bul. 53, Sept., 1902	892
Oklahoma Station:	
Bul. 55, Dec., 1902	855
Bul. 56, Dec., 1902	859
Eastern Oregon Station:	
Bul. 1	856
Pennsylvania Station:	
Bul. 62, Jan., 1903	861
Porto Rico Station:	
Bul. 1, Sept., 1902 (5 cents)	929
Bul. 2, Sept., 1902 (5 cents)	885
South Carolina Station:	
Bul. 74, Nov., 1902	901
Bul. 76, Nov., 1902	855
Bul. 77, Nov., 1902	837
Bul. 78, Dec., 1902	835
Virginia Station:	
An. Rpt., 1902	846, 929
West Virginia Station:	
Bul. 81, Apr., 1902	858
Bul. 82, Apr., 1902	862
Bul. 83, Sept., 1902	902

NOTE.—The publications of the United States Department of Agriculture may be purchased from the Superintendent of Documents, Washington, D. C. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The Editor and H. W. Lawson.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. Beal.
Botany and Diseases of Plants—Walter H. Evans, Ph. D.
Foods and Animal Production—C. F. Langworthy, Ph. D.
Field Crops—J. I. Schulte.
Entomology and Veterinary Science—E. V. Wilcox, Ph. D.
Horticulture—C. B. Smith.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 10.

	Page.
Editorial note: Progress of secondary education in agriculture	933
Recent work in agricultural science	938
Notes	1034

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

Errors in manure sampling and analysis, W. Frear	938
The estimation of available phosphoric acid in manures, W. F. Sutherst	939
On the solution of insoluble calcium phosphate by means of ammonium citrate solutions, K. Zulkowski and F. Cedivoda	939
On the determination of citric-acid soluble phosphoric acid, W. Naumann	940
The preparation of molybdic solution for the determination of phosphoric acid, A. Mercier	940
The rapid determination of potash in kainit, M. Passon	940
Apparatus for the determination of nitrates and nitrites, E. Commanducci	940
The volumetric determination of nitric acid, J. K. Phelps	940
Simple method for quantitative determination of nitric acid in water, G. Frerichs	940
The determination of hardness in water, W. Peters	940
Analysis of milk and dairy products	941
The determination of the percentage of water in butter	941
Wollny's refractometer for determining the fat content of skim milk, C. Barthel	941
Methods of incineration for determining chlorin in animal solutions and organs as well as in foods, C. Strzyzowski	941
The chemistry of plant and animal life, H. Snyder	941
Text-book of agricultural chemistry, A. Mayer	941
The application of the equilibrium law to the separation of crystals from complex solutions and to the formation of oceanic salt deposits, E. F. Armstrong	941
Methods for investigating canceling inks and other stamping inks, E. E. Ewell	942
New laboratory apparatus, C. Zahn	942
Report of the Swedish chemical control stations for 1900, A. Lyttkens	942

BOTANY.

Page
North American species of Leptochloa, A. S. Hitchcock 94
Notes on the poisonous plants of Nebraska, C. E. Bessey 94
Notes on fungi, C. G. Lloyd 94
Note on the water content of certain plants, W. R. Lazenby 94
Influence of humidity on formation and development of stomata, G. Mariani 94
The effect of concentration of solutions on the respiration of plants, W. Palladine and A. Komleff 94
Effect of minerals on respiration of germinating plants, S. Krzesnieniewski 94
The effect of temperature on carbon dioxid assimilation, G. L. C. Matthaei 94
Influence of previous environment in variety tests, T. L. Lyon 94
Individuality of plants as a factor in nutrition studies, E. B. Voorhees and J. G. Lipmans 94
Decomposition of proteid materials in plants, H. Karapétoff, M. Sabachnikoff 94
Influence of wounds on formation of proteid material in plants, J. Kovchoff 94
Vegetable oils and their formation, C. Hartwich and W. Uhlmann 94
Limit of endurance of farm crops for injurious substances, F. B. Guthrie and R. Helms 94
Some effects of freezing on structure of plant cells, L. Matruchot, M. Molliard 94
The rate of absorption of nitrogen by cereals, J. Henry 94
Investigations on root tubercles of Leguminosæ, L. Hiltner and K. Störmer 94
Observations on some algæ causing "water bloom," N. P. B. Nelson 94
The suspension of life at low temperatures, A. Macfadyen and S. Rowland 94
The necessary presence of bacteria in cultures of Myxomycetes, Pinoy 94

METEOROLOGY—CLIMATOLOGY.

Report of the Chief of the Weather Bureau, 1901–2 94
Annual summary of meteorological observations in the United States, 1902 94
Meteorological chart of the Great Lakes, A. J. Henry and N. B. Conger 94
Meteorological observations, C. S. Phelps 94
Meteorological observations, J. E. Ostrander and S. C. Bacon 94
Meteorological record for 1901 94
Meteorological observations, D. V. C. Manso de Zuñiga 94
Meteorological tables, C. E. Magnusson 94
The availability of New Mexico's climate for outdoor life, J. Weinzirl 94
The climate of Garrett County, Maryland, O. L. Fassig 94
The climate of Cecil County, Maryland, O. L. Fassig 94
A study of the climate of Tunis, G. Ginestous 94
Rainfall in the agricultural districts of Queensland, C. L. Wragge 94
Analysis of the rainfall records of New South Wales, J. Barling 94
Investigation of the upper atmosphere by means of kites 94
The use of barometric variations in forecasting weather, J. Guzman 94

WATER—SOILS.

Water supply and sewerage 94
Purification of river water, A. J. J. Vandevelde and F. Leperre 94
Hydrography of Garrett County, Maryland, H. A. Pressey and E. G. Paul 94
The hydrography of Cecil County, Maryland, H. A. Pressey 94
Processes of mineralization of water as related to the geological character of soils and rocks, E. Casoria 94
Observations on soil moisture in New Mexico, C. E. Magnusson 94
An experiment on soil improvement, C. S. Phelps 94
Experiments on black marsh soil, A. R. Whitson 94
The soils of Garrett County, Maryland, C. W. Dorsey 95
The soils of Cecil County, Maryland, C. W. Dorsey and J. A. Bonsteel 95
Crop and soil data for cooperative study of available plant food, C. C. Moore 95
Report on analyses of the soil of coffee plantations, J. G. Kramers 95
The occurrence of climatic soil zones in Spain, Ramann 95

FERTILIZERS.

Culture trials with precipitated calcium phosphate, II, H. G. Söderbaum 95
The action of phosphoric acid in the presence of lime, Bachmann 95
Effect of moisture on availability of dehydrated phosphate of alumina, F. W. Morse 95

Page.
Action of phosphatic fertilizers on forage plants, L. Bonetat and P. Touchard. 952
Pot experiments with nitrogenous fertilizers in 1901, C. S. Phelps 953
Nitrate of soda and sulphate of ammonia, L. Grandeau 953
The action of 40 per cent potash salt and kainit on summer crops, H. Bachmann. 953
Top-dressing with potash on sandy soils, Bachmann 953
Dried blood, E. M. Paget 953
Concentrated tankage, E. M. Paget 953
Report of observations on the peat industry in Canada, J. G. Thaulow 953
Report of observations on the peat industry in European countries, A. Dal 953
On the composition and use of flotsam, F. P. Bonuccelli 953
Analyses of commercial fertilizers, M. A. Scovell and H. E. Curtis 953
Analysis of commercial fertilizers sold in Maryland, H. B. McDonnell et al. 954
Analyses of licensed fertilizers, 1902, F. W. Woll and G. A. Olson 954
Fertilizers licensed for sale in Wisconsin in 1903, F. W. Woll 954

FIELD CROPS.

Field experiments with fertilizers, C. S. Phelps 954
Fertilizer experiments with wheat and barley, G. P. Foaden 954
Relation of crop production to amount of water available and methods of cultivation, A. R. Whitson 955
Influence of soil on the protein content of crops, A. R. Whitson et al 955
Experiments with grain and forage plants, 1902, R. A. Moore 957
Cultivated forage crops of the Northwestern States, A. S. Hitchcock 958
Alfalfa, its chemical development, H. Snyder and J. A. Hummel 958
Variety tests with barley, C. Sonne 959
Commercial bean growing in New York, J. L. Stone 959
Flax culture, R. Kuhnert 960
Corchorus, jute, or gœni, H. J. Wigman 960
Variety tests with oats, K. Hansen 960
Potato culture, A. Agee 960
Variety tests with potatoes, 1881–1898, A. J. Hansen 960
Spelt, emmer, and einkorn, P. Hauptfleisch 960
Sugar-beet experiments during 1902, F. W. Woll and R. A. Moore 961
The leaf in its relation to the sugar content of the beet, H. Plahn 961
Fertilizing and planting sweet potatoes, M. B. Waite 961
Macaroni wheats, T. L. Lyon 961

HORTICULTURE.

On the manuring of vegetable and fruit crops, F. W. E. Shrivell and B. Dyer. 961
The manuring of garden and allotment crops, P. L. de Vilmorin 963
Report on vegetables and plants grown at Chiswick in 1902 963
Asparagus; its culture, yield, and future, C. Alvargonzález 963
Ginseng culture, N. O. Booth 963
Lettuce, E. S. Brown 963
Onions, E. S. Brown 963
The artificial crossing of Victoria and Princess Royal peas, N. L. Chrestensen. 963
The tomato, J. J. Willis 964
The tomato, E. J. Kyle and E. C. Green 964
Variations in some introduced garden vegetables, H. C. Irish 964
The fruit plantation. Stone fruits, W. B. Alwood 964
Notes on some of the more important varieties of apples, W. B. Alwood 964
Apple shipments to the Orient, H. B. Miller 965
Varieties of fruit that can be profitably grown in Pennsylvania, G. Hiester 965
Thinnage of peaches, E. J. Kyle 965
Sulphured dried fruit and its examination, W. Fresenius and L. Grünnut 965
Modern fruit culture, E. Durand. 965
Modifications in the forms of fruits, P. Passy 965
Modifications in the form of the pear and apple by dimorphism, P. Passy 965
Concerning root pruning, A. C. Ide 965
Banana and plantain culture, T. Koschny 965
Cacao culture in the Philippines, W. S. Lyon 966
Cacao; experiments in drying at Dominica 966
Coffea stenophylla, P. von Romburgh 966
Silkworm food plants cultivation and propagation, G. W. Oliver 966
Fourth report on experiment in pinching raspberry shoots, F. Cranefield 966

Page.
Experiments in orchard, vineyard, and cellar, H. Schellenberg 967
Pruning green grapevines, J. M. Guillon 967
Experiments in manuring grapes, E. Marre 967
Budding the pecan, G. W. Oliver 968
Experiments with manures for chrysanthemums, G. Truffaut 969
Conference on roses at the Holland House 970
Mendel's principles applied to orchid hybrids, C. C. Hurst 970
The book of the wild garden, S. W. Fitzherbert 970
A new design of greenhouse 971
Horticulture in Egypt, L. Saunders 971

FORESTRY.

The principal species of wood—their characteristic properties, C. H. Snow 971
Applied ecology, B. E. Fernow 971
A study of the redwood, R. T. Fisher 971
Report of the superintendent of State forests, W. F. Fox 972
A report on dead and diseased trees on Long Island, A. Knechtel 972
Gathering spruce seed, C. R. Pettis 972
Report of the Maine forest commissioner, 1902, E. E. Ring 972
A study of the Maine spruce, R. S. Hosmer 973
Distribution of plants in forest regions, W. M. Munson 973
Management of pulp wood forests, A. Cary 973
Regeneration of woods from seed naturally or artificially sown, A. C. Forbes 973
The natural regeneration of oak and beech woods, L. S. Wood 974
The management of public and private parks, J. Wilson 974
Sawmills and wood-working machinery for estates, J. Price 974
Reclaiming and planting bog land, T. Conway 974
Revenue from the forest of Compiègne for 1900 974
Trees on the farm, H. Pye 974

SEEDS—WEEDS.

The acquisition of the germinative faculty in ripening seed, P. Mazé 974
The influence of formaldehyde on the germination of oats, F. Cranefield 975
The effect of depth of planting on germination of clover seed, F. Cranefield 975
The effect of sunlight upon the germinative power of seed, E. Laurent 975
Experiments on the germination of seed preserved in a vacuum, E. Laurent 975
Red clover seed and its impurities, D. Finlayson 976
Notes on weeds, T. W. Kirk 976

DISEASES OF PLANTS.

Plant depredations and plant culture, F. W. Rane 976
The æcidium as a device to restore vigor to the fungus, J. C. Arthur 976
A contribution to the knowledge of rust fungi, E. Jacky 976
Inoculation experiments with some Uredineæ, F. Bubak 976
Culture methods with Uredineæ, M. A. Carleton 977
Some injurious fungi occurring on cultivated plants in Dutch East Africa, P. Hennings 977
Two new fungi from Ohio, F. Bubak 977
Concerning the name and distribution of *Urophlyctis bohemica*, P. Magnus 977
A contribution to the mycology of Liguria, A. Magnaghi 977
The development of a new parasitic myceromycete, R. Farneti 977
Notes on two diseases of cotton, F. Fletcher 977
Experiments with rust-resisting wheats, W. L. Summers 977
Concerning the so-called brusone of wheat, V. Peglion 978
Studies on the germination of ergot, S. J. Rostowzew 978
Seed treatment for the prevention of millet smuts, L. Hecke 978
Treatment of smuts and rusts, D. A. Saunders 978
The prevention of oat smut and potato scab, R. A. Moore 978
Some potato diseases 979
A new potato disease, M. C. Potter 979
The potato disease, E. A. Nobbs 980
A nematode disease of rice, J. van Breda de Haan 980
Tobacco diseases in Galicia, M. Raciborski 980
Erysiphe lamprocarpa on tobacco, G. E. Anastasia 980

Page.
Apple fungi, G. H. French, J. C. Whitten, J. C. Blair, et al 980
A contribution to the knowledge of Monilia diseases, K. Schilbersky 980
The rotting and mummifying of fruits, P. Passy 980
A disease of plums, J. Dufour 980
Notes on a disease of lemons in Sicily, G. Briosi and R. Farneti 981
Diseased cocoanut palms 981
Raspberry cane blight and raspberry yellows, F. C. Stewart and H. J. Eustace. 981
The preventive treatment of oidium, de Boissard 982
Brunissure, P. Viala 982
The brown rot disease of redwood, H. von Schrenk 982
A disease of the white ash caused by *Polyporus fraxinophilus*, H. von Schrenk. 982
A new orchid parasite, L. Montemartini 982
A Pelargonium disease, G. Massee 983
Fairy ring spot of carnations, P. Voglino 983
Preliminary efforts to develop a continuous process of seed disinfection by means of formaldehyde vapor, H. L. Bolley 983
The use of the centrifuge in diagnosing plant diseases, H. L. Bolley 983
Early spraying as a means of protection against spring frosts, L. Degrully 983
The reduction of lime in fungicides sprayed upon leaves, G. E. Marchetti 983

ENTOMOLOGY.

Thirty-third annual report of the Entomological Society of Ontario, 1902 984
Second report of the State entomologist, W. E. Britton 984
Reports on noxious and beneficial insects of Illinois, S. A. Forbes 985
Report of Montana State Board of Horticulture, 1901–2, C. H. Edwards 986
Nursery inspection in West Virginia, J. H. Stewart 986
Proceedings of the Entomological Society of Washington 987
Report on injurious insects and plant diseases in 1902, W. M. Schöyen 987
Injurious insects, E. Fleutiaux 987
Recent experience with destructive insects, Mary E. Murtfeldt 987
A new enemy of cereals, F. Malmejac 987
Hessian fly experiments, H. Garman 987
Woolly aphis or American blight, W. W. Froggatt 988
Investigating the codling worm, M. O. Cole 988
The periodical cicada and its occurrence in Maryland in 1902, A. L. Quaintance 988
Insect enemies of the redwood, A. D. Hopkins 988
Insect enemies of the evergreens, E. A. Popenoe 988
Lime, sulphur, and salt wash, C. L. Marlatt 989
Spraying peach trees with crude petroleum for San José scale, F. M. Webster. 989
Crude petroleum as an insecticide, E. P. Felt 989
Insecticides for use in Hawaii, D. L. Van Dine 989
Liquid and dust spraying, J. C. Evans et al 989
Spray calendar, F. H. Blodgett and T. B. Symons 989
A practical means of destroying cockroaches, C. Chalot 989
The culture of the mulberry silkworm, Henrietta A. Kelly 989
Pebrine and related microsporidia, A. Lutz and A. Splendore 989

FOODS—NUTRITION.

Third report on food products for 1902, B. W. Kilgore 990
The digestibility and availability of food materials, W. O. Atwater 990
Percentage composition and pecuniary value of human foods, J. König 991
Composition and food value of the principal vegetables, Balland 991
Food value of some of the edible fungi of Ames, J. B. Weems and A. W. Hess. 991
Bread making from the standpoint of public health, A. Laurent 991
Determination of baking quality of flour by the gliadimeter, E. Fleurent 991
Concerning the identification of currant jam, J. Schindler 991
Antiseptics and their use in the preservation of food, S. C. Prescott 992
Are antiseptics occurring in preserved foods harmful? F. Bordas 992
The preservation of meat, L. Vaillard 992
The cleavage of gelatin, P. A. Levene 992
The influence of alcohol on the metabolism of protein, R. Rosemann 992
Hydrolysis of fats and oils by means of dilute acids, J. Lewkowitsch 992
Experiment on the excretion of carbon dioxid during static and negative muscular work, J. E. Johansson and G. Koraen 992

ANIMAL PRODUCTION.

	Page.
Feeding value and digestibility of alfalfa, H. Snyder and J. A. Hummel	992
The digestibility of hog millet, H. Snyder and J. A. Hummel	993
The available energy of timothy hay, H. P. Armsby and J. A. Fries	993
Combustible gases escaping from an animal, J. A. Fries	994
Cotton-seed meal *v.* decorticated cotton cake, T. Winter	994
Substitutes for cream in skim milk as calf food	994
Feeding experiments with calves	994
Experiments in sheep husbandry, T. Shaw	994
Sheep-feeding experiments at Newton Rigg, T. H. Middleton	995
The improvement of pasture as tested by the effects on sheep, T. B. Wood	995
Three types of market sheep, W. L. Carlyle	996
Comparative value and effect upon the lambs of feeding various grain rations to pregnant ewes, W. L. Carlyle and T. F. McConnell	996
Experiments in sheep breeding, T. Winter	996
Grazing and feeding experiments with pigs, J. F. Duggar	996
Whole corn compared with corn meal for fattening pigs, W. A. Henry	999
Ground peas *v.* corn meal for pigs, W. L. Carlyle and T. F. McConnell	999
Razorback *v.* cross-bred razorback and improved breeds of hogs, W. L. Carlyle	1000
Horse feeding, H. Wibbens	1000
Agencies for purchase of Australian horses for military purposes, A. Bruce	1000
Suggestions for Australian horse and mule breeders, A. Bruce	1000
Mules at the Hawkesbury College farm, H. W. Potts	1000
Sugar mules, H. d'Anchald	1001
Concerning the feeding value of hay from irrigated meadows, F. Tangl	1001
Poultry notes, J. Barclay	1001
Egg and poultry raising at home, W. M. Elkington	1001
The peanut for poultry	1001
Chemical composition and formation of goose fat, S. Weiser and A. Zaitschek	1001
A new departure in the science of fattening, R. Warington	1001
Analysis of fodders and feeding stuffs, W. O. Atwater	1001
Concentrated feeds, J. B. Lindsey	1001
Licensed commercial feeding stuffs for 1902, F. W. Woll and G. A. Olson	1001
Concentrated feeding stuffs licensed for sale in Wisconsin, 1903, F. W. Woll	1002
The Wisconsin feeding-stuff law	1002
Food for live stock	1002
Barley chaff as a cattle feed, J. P. Wagner	1002
Chemical composition of the bottle-tree, J. C. Brünnich and W. Maxwell	1002
Concerning cacao shells, P. Welmans	1002
Copra products at Marseille, R. P. Skinner	1002
Crushed corncobs, F. B. Guthrie	1002
The value of Kurrajong as a fodder tree, W. Macdonald	1002
Molassecuit	1002
Composition of molasses feeds and brewers' grains, L. Grandeau	1003
Poppies and poppy-seed cake, F. Mach	1003
Sugar cane as a fodder for stock, F. B. Guthrie	1003
On the protein compounds in whale-flesh meal, A. Kavli	1003
Succus entericus and pancreatic digestion, E. Pozerski	1003
Electrical conductivity and lowered freezing point as indicators of protein cleavage, M. Oker-Blom	1003

DAIRY FARMING—DAIRYING.

Investigations in milk production, T. L. Haecker	1003
A study of rations fed to milch cows in Connecticut, C. S. Phelps	1005
Value of sugar beets as a food for milch cows, G. W. Berglund	1006
Official tests of dairy cows, 1901–2, F. W. Woll	1007
Efficiency of a covered pail in excluding filth and bacteria from milk, W. A. Stocking, jr	1007
Growth of bacteria in normal milk, H. W. Conn and W. M. Esten	1008
The presence of tubercle bacilli in market milk and butter, Pawlowsky	1009
A new method of sterilizing milk, C. C. L. Budde	1009
Sterilization of milk by means of peroxid of hydrogen, C. Barthel	1009
Observations on the use of acid tests for milk and cream, E. H. Farrington	1010
A modified cream-test bottle, E. H. Farrington	1010
The composition of frozen milk, E. H. Farrington	1010

Page.
Ekenberg's "desiccator" 1010
Swedish butter exhibits, 1901, N. Engström 1010
Water content of butter, L. F. Rosengren 1011
Conditions affecting the character of butter fat, T. E. Thorpe 1011
Pasteurized cream butter, E. H. Farrington and J. H. Godfrey 1011
Difficulties in drawing conclusions from butter scores, E. H. Farrington 1011
Influence of cold curing on the quality of Cheddar cheese, S. M. Babcock et al. 1011
Influence of temperatures of 60° F. on cold-cured cheese, S. M. Babcock et al. 1012
Influence of rennet on cold-cured cheese, S. M. Babcock et al 1012
Causes of white specks in cold-cured cheese, S. M. Babcock et al 1012
Cheese experiments with yeast cultures, S. J. Benterud and O. Iversen 1013
Notes for cheese makers, J. A. Ruddick 1013
Cheese making on the farm, H. E. Alvord 1014
Modern dairy science and practice, L. L. Van Slyke 1014
The statistics of the dairy, H. E. Alvord 1014

VETERINARY SCIENCE AND PRACTICE.

Modern theories of bacterial immunity, H. C. Ernst 1014
A review of current theories regarding immunity, J. Ritchie 1014
Investigations on the antibodies of spores, W. Defalle 1014
Immunization against immune serum, E. W. A. Walker 1015
Note on toxic and antitoxic action in vitro and in corpore, E. F. Bashford ... 1015
Protective and curative action of anthrax serum obtained from dogs, F. Sanfelice 1015
Destruction of toxins by peroxids and oxydases of animal and vegetable origin, N. Sieber 1015
The bactericidal action of certain aromatic substances, H. Marx 1015
Morphological changes in the blood during hemolysis, Y. Fukuhara 1016
The red blood corpuscles and infection, M. Dominici 1016
Structure and function of wandering cells, phagocytes, etc., R. Klemensiewicz. 1016
Infectiveness of milk of cows which have reacted to the tuberculin test, J. R. Mohler 1016
Human and bovine tuberculosis, N. Raw 1017
The transmissibility of human tuberculosis to cattle and goats, A. Moeller ... 1018
Transmission of tuberculosis of man to cattle, J. Fibiger and C. O. Jensen 1018
The transmissibility of bovine tuberculosis to man, Köhler 1018
Tuberculous infection through the alimentary tract, A. Heller 1018
Inoculation tuberculosis, O. Lassar 1018
Pearl disease and human tuberculosis, M. Wolff 1019
What is pearl disease? J. Orth 1019
Tuberculosis of the transversely striated muscles, S. Saltykow 1019
Combating bovine tuberculosis in Norway, O. Malm 1019
The question of acclimation to tuberculin, Bartels 1020
Von Behring's method of immunizing cattle against tuberculosis, Melde 1020
Experimental investigations on action of dead tubercle bacilli, C. Sternberg .. 1020
Development of the treatment of parturient paresis during the last 5 years, J. Schmidt 1020
On the treatment of parturient paresis, J. Schmidt 1021
Treatment of parturient paresis by iodid of potash, Nevermann 1021
A new treatment of parturient paresis, E. Thierry 1021
Parturient paresis before parturition and the theory and treatment of this disease by means of filtered air, A. Teetz 1021
Subacute parturient paresis and its treatment with air, A. Teetz 1021
Simple treatment of parturient paresis, Evers 1021
A new instrument for use in the treatment of parturient paresis, Nevermann .. 1022
Foot-and-mouth disease and sulphate of iron, A. Bouchaud 1022
Foot-and-mouth disease and its treatment, G. d'Utra 1022
Study of the diseases included under the name actinomycosis, J. Lignières and J. Spitz 1022
The action of iodin upon actinomyces, Schmaltz 1022
Vaccination for pleuro-pneumonia, Leistikow 1022
Study of the bacteriology of pyelonephritis of cattle, Liénaux and Zwaenepoel. 1022
The therapeutic use of tannoform in intestinal diseases of calves, Schünhoff .. 1023
The treatment of green diarrhea of calves, G. Carle 1023

Page.
Coccidiosis of sheep, and the parasitic organism, G. Moussu and G. Marotel .. 1023
Some pig diseases 1023
Swine erysipelas, M. Tempel 1023
Recent results in combating swine plague, Schreiber 1023
A pyogenic micro-organism in the hog, W. Grips 1023
Septicemic brown neck of hogs, Graffunder and Schreiber 1023
Behavior of lymphatic apparatus in intestinal ulcerations in hogs, Seiler 1024
Glanders, R. Hottinger 1024
Tsetse fly disease in Togo, West Africa, H. Ziemann 1024
The so-called Borna horse disease, Enders 1024
Scratches or grease heel in horses, N. S. Mayo 1024
Mammary botryomycosis in the horse, P. Unterhössel 1024
The origin of aneurysma verminosum equi, A. Sticker 1024
A study of the morphology of the blood of the horse, S. H. Burnett 1024
Observations on rabies in the district of Habelschwerdt, C. Wittlinger 1025
Antirabies vaccinations in St. Petersburg, V. Kraiouchkine 1025
Vaccination of dogs for distemper, H. Meyer 1025
Alopecia areata pigmentosa in dogs, V. S. Trofimov 1025
The action of ticks upon animal blood, P. Grützner 1025
The tapeworms of ruminants, N. Kholodkovski 1025
Observations on fowl plague, Künnemann 1025
Serum therapy in fowl cholera, Willerding 1026
The chicken mite, G. W. Herrick 1026
The incineration in the open field of carcasses affected with anthrax, Volmer. 1026
Innocuous disposal of animal carcasses by means of burning, Lothes and Profé. 1026
American meat inspection, A. Zschocke 1026

TECHNOLOGY.

A study of cider making in France, Germany, and England, W. B. Alwood .. 1026
Effects of fermentation on composition of cider and vinegar, C. A. Browne, jr. 1027
Notes on vinegar making, E. F. Pernot 1028
Experiments in wine making, H. Schellenberg 1028
Composition and determination of differently prepared wines, W. Kelhofer .. 1028
American wines at the Paris Exposition of 1900, H. W. Wiley; with a monograph on the manufacture of wines in California, H. Lachman 1029
Agricultural fermentation industries, E. Boullanger 1029
Musts and wines in distilling, L. Lévy 1029
Preparation of cherry wine with and without the addition of currants, W. Kelhofer 1029
Annual report on investigations and progress in manufacture of sugar, J. Bock. 1029
Cassava as a competitor of maize in the production of starch, G. Archbold 1029
A new method of extracting olive oil, A. Funaro 1030
Modern American tanning 1030

AGRICULTURAL ENGINEERING.

Irrigation investigations, Humboldt River Valley, Nevada, J. D. Stannard 1030
Eleventh Biennial Report of State Engineer of Colorado, 1901–2, A. J. McCune. 1030
Irrigation works of India, R. F. Patterson 1030
Irrigation in Spain and North Africa, J. Brunhes 1030
The Nile dams and reservoir, Sir B. Baker 1030
A self-adjusting weir 1030
On the conversion of a tidal marsh into a meadow, G. Becker 1030
Recent progress in the field of agricultural machinery 1030
Methods and machines for cultivating the soil, M. Ringelmann 1031
Tests of binders, 1902, A. Nachtweh 1031
Practicability and adaptability of gasoline engines for agricultural conditions, G. Timberg 1031
Note on simple machines for extracting plantain fiber, R. L. Proudlock 1031
Measures for preventing accidents with agricultural machinery, W. Hoffstedt. 1031
Proceedings of the Jefferson Memorial and Interstate Good Roads Convention. 1031
Road construction, L. H. Adams 1031
Silos and silage, C. S. Plumb 1031

MISCELLANEOUS.

	Page.
Proceedings of sixteenth annual convention of Association of American Agricultural Colleges and Experiment Stations, A. C. True et al	1032
Establishment of agricultural experiment stations in Mexico, S. Bonansea	1032
The promotion of agricultural science, W. H. Jordan	1032
General agriculture, P. Diffloth	1032
Practical farming and gardening	1032
The book of the farmer, A. Bruttini	1033
The Lupitz estate and its production, C. Vibrans	1033
Recent foreign explorations as bearing on the agricultural development of the Southern States, S. A. Knapp	1033
Cooperation among farmers for certain economic ends, M. Hansson et al	1033
Report of the Bureau of Farmers' Institutes, 1900	1033
The officials and laborers of Upper Egypt, H. C. Hanson	1033
Commercial relations of United States with foreign countries during 1902	1033
Agricultural and commercial statistics for 1901, B. E. McLin	1033
Agricultural returns for Great Britain, 1902	1033
General index to reports and bulletins of Canada experimental farms, 1887–1901	1033

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Page.

Alabama College Station:
Bul. 122, Jan., 1903 996
Connecticut State Station:
An. Rpt., 1902, pt. 2 ..... 984, 1001, 1005, 1007, 1008
Connecticut Storrs Station:
Fourteenth An. Rpt., 1901 . 990, 1031
Georgia Station:
Fifteenth An. Rpt., 1902 ..... 947, 949, 953, 954, 1031
Hawaii Station:
Bul. 3 989
Kentucky Station:
Bul. 103, Dec., 1902 987
Bul. 104, Dec. 31, 1902 953
Maryland Station:
Bul. 87, Nov., 1902 988
Massachusetts Station:
Bul. 85, Jan., 1903 1001
Met. Buls., 169–171, Jan.-Mar., 1903 947
Minnesota Station:
Bul. 78, Jan., 1903 994
Bul. 79, Jan., 1903 1003
Bul. 80, Mar., 1903 .... 958, 992, 995
Mississippi Station:
Bul. 78, Nov., 1902 1026
Nebraska Station:
Bul. 78, Mar. 11, 1903 961
Nevada Station:
Bul. 54, 1901 1030
New York State Station:
Bul. 226, Dec., 1902 981
Twentieth An. Rpt., 1901 .... 947, 963, 1031
New York Cornell Station:
Bul. 210, Jan., 1903 959
North Carolina Station:
Twenty-fourth An. Rpt., 1901 . 1032
Oregon Station:
Bul. 73, Oct., 1902 1023
South Dakota Station:
Bul. 75, June, 1902 978
Tennessee Station:
Fifteenth An. Rpt., 1902 1032
Texas Station:
Bul. 65, Jan., 1903 964

Stations in the United States—Continued.

Page.

Virginia Station:
Bul. 129, Oct., 1901 964
Bul. 130, Nov., 1901 964
West Virginia Station:
Nursery Inspection Rpt., 1901–2 986
Wisconsin Station:
Bul. 98, Feb., 1903 978
Bul. 99, Feb., 1903 ..... 954, 1002
Nineteenth An. Rpt., 1902 . 949, 954, 955, 957, 961, 966, 975, 996, 999, 1000, 1001, 1002, 1007, 1010, 1011, 1012, 1031, 1032

U. S. Department of Agriculture.

Farmers' Bul. 32 (revised) 1031
Farmers' Bul. 165 989
Farmers' Bul. 166 1014
Bureau of Animal Industry:
Bul. 44 (10 cents) 1016
Bureau of Chemistry:
Bul. 71 (20 cents) 1026
Bul. 72 (5 cents) 1029
Circ. 11 950
Circ. 12 942
Bureau of Forestry:
Bul. 38 (20 cents) 971, 982, 988
Bureau of Plant Industry:
Bul. 30 (10 cents) 968
Bul. 31 (10 cents) 958
Bul. 32 (10 cents) 982
Bul. 33 (15 cents) 942
Bul. 34 (15 cents) 966
Bul. 35 (15 cents) 1033
Weather Bureau:
Monthly Weather Review, vol. 30, No. 13 (20 cents) ... 947
Meteorological Chart of the Great Lakes, 1902, No. 2 (10 cents) 947
Rpt. 1901–2 947
Office of Experiment Stations:
Bul. 123 (10 cents) 1032
Division of Entomology:
Bul. 39, new series (5 cents) .. 989
Circ. 52, second series 989
Office of Public Road Inquiries:
Bul. 25 (10 cents) 1031

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Chemistry, Dairy Farming, and Dairying—The Editor and H. W. Lawson.
Meteorology, Fertilizers and Soils (including methods of analysis), and Agricultural Engineering—W. H. Beal.
Botany and Diseases of Plants—Walter H. Evans, Ph. D.
Foods and Animal Production—C. F. Langworthy, Ph. D.
Field Crops—J. I. Schulte.
Entomology and Veterinary Science—E. V. Wilcox, Ph. D.
Horticulture—C. B. Smith.
With the cooperation of the scientific divisions of the Department.

CONTENTS OF VOL. XIV, NO. 11.

Editorial notes: Page.
The exhibit of the land-grant colleges and the experiment stations at St. Louis 1037
Conclusion of volume fourteen 1041
Recent work in agricultural science 1042
Notes 1134

SUBJECT LIST OF ABSTRACTS.

CHEMISTRY.

Improved method for determination of total alkalis in soils, J. H. Petit 1042
The solubility of barium sulphate, G. S. Fraps 1042
Determination of total phosphoric acid and potash in soils, C. B. Williams 1042
Determination of citric-acid-soluble phosphoric acid, R. Woy 1042
Determination of citric-acid-soluble phosphoric acid, O. Böttcher 1042
Acid required in the preparation of superphosphates, W. Strzoda 1042
The determination of nitrogen in nitrates, A. Wohl and O. Poppenberg 1043
Determination of organic nitrogen, A. Quartaroli 1043
Burette and solutions for use in nitrogen determination, A. W. Bosworth 1043
The estimation of small amounts of carbon monoxid in the air, Spitta 1043
The distribution of arsenic in nature, F. Garrigou 1043
The determination of sulphur in plants, G. S. Fraps 1043
The determination of sulphur and chlorin in plants, G. S. Fraps 1043
Sulphur content of some vegetable materials, W. A. Withers and G. S. Fraps 1043
The determination of pentosan-free crude fiber, G. S. Fraps 1043
Russian export butter and methods of its examination, I. Shirokikh 1044
Studies of methods of estimating fat in animal substances, W. Glikin 1044
Estimation of the salicylic acid in berries and stone fruits, Süss 1044
Some of the constituents of cacao and their determination, J. Dekker 1044
Investigations on Chinese rhubarb, K. Heuberger 1044
Hydrolysis of crystallized oxyhemoglobin of horses' blood, E. Abderhalden 1044
Hydrolysis of crystallized serum albumin of horses' blood, E. Abderhalden 1044

Page.

The hydrolysis of edistin, E. Abderhalden 1044
The hydrolysis of zein by hydrochloric acid, L. Langstein 1044
Tests and reagents, chemical and microscopical, A. I. Cohn 1045
Report of the chemists, C. H. Jones and B. O. White 1045
Report on the progress of physical chemistry and physics, M. Rudolphi 1045
Convention of Association of Official Agricultural Chemists, 1902 1045

BOTANY.

Reserve carbohydrates in ligneous plants, Leclerc du Sablon 1045
A study of the reserve carbohydrates of some palms, E. Liénard 1045
Formation of albumen by the higher plants in the dark, I. Shulov 1046
Influence of organic materials on the development of plants, J. Laurent 1046
The germination of pollen in the presence of stigmas, P. P. Richer 1046
Canadian experiments with Nitragin, F. T. Shutt and A. T. Charron 1047
Photosynthesis without living plants, L. Macchiati 1047
Methods in plant physiology, H. S. Reed 1047
Phyllobiology, A. Hansgirg 1047
Reports of Danish experiment stations for plant culture during 1900 and 1901 1047

FERMENTATION—BACTERIOLOGY.

Further studies on nitrogen-assimilating bacteria, Gerlach and Vogel 1048
Nitrogen assimilation by bacteria without symbiosis, J. Vogel 1048
Specific identity of tubercle bacteria of the Leguminosæ, H. Buhlert 1048
A contribution to the Alinit question, S. Severin 1049
Bacteria in the soil, B. H. Buxton 1049
Photobacteria in chlorophyll investigations, M. W. Beijerinck 1049
Pseudomonas fragariæ, a bacterium causing a strawberry-like odor, T. Gruber 1049
Bacterial flora of the acid fermentation of some foods, R. Weiss 1049
Luminous bacteria, J. E. Barnard and A. Macfadyen 1049
Concerning the mechanism of agglutination, R. G. Smith 1049
International catalogue of scientific literature. R—Bacteriology 1049
The practice of industrial fermentation, E. Ozard 1050
Utilization of micro-organisms in the arts, F. Lafar and C. T. C. Salter 1050
The general theory of the action of diastases, V. Henri 1050
Proteolytic enzyms in plants, S. H. Vines 1051
The growth and reproduction of *Amylomyces rouxii*, J. Turquet 1051

ZOOLOGY.

Biological reconnoissance in the vicinity of Flathead Lake, M. J. Elrod 1052
Annual report of the Zoological Society of Philadelphia, A. E. Brown 1052
The flame-breasted robin (*Petræca phœnicea*), C. French 1052
The house sparrow, J. Percival 1052
Contributions to the ornithology of Saõ Paulo, H. von Ihering 1052
Necessity of a federal game law and the protection of birds, A. von Ihering 1052
Destroying prairie dogs and pocket gophers, D. E. Lantz 1052
Myriapods in the Museum of Saõ Paulo, H. W. Brölemann 1052

METEOROLOGY—CLIMATOLOGY.

Report on international cloud observations, H. H. Hildebrandsson 1053
The climate of the Bermuda Islands, A. E. Verrill 1053
Meteorological observations for 1902 1054
The weather during the agricultural year 1901–2 1054
Crops of Scotland for 1902, and meteorology of the year, A. Buchan 1054
Variations in rainfall at Hawkesbury Agricultural College, C. T. Musson 1054
Analysis of red rain of February 22, R. A. Earp 1054

AIR—WATER—SOILS.

On the proportion of hydrogen in atmospheric air, A. Leduc 1055
Proportion of atmospheric hydrogen, A. Gautier 1055
Evaporation, R. E. Trimble 1055

Page.
Water supply and prevention of waste in European cities, C. O. Johnson 1055
New methods and apparatus for sterilizing water, Kausch 1055
Report on artesian wells, L. Woolman 1055
Sinking of subterranean waters and the disappearance of springs, E. A. Martel 1055
Absorption of ammonia by sea water, J. Thoulet 1055
The Murray waters 1055
Preliminary investigation of the soil and water of the Fayoum Province 1055
Influence of fertilizers on the water-holding capacity of soils, E. Gross 1055
Soil temperatures 1056
Investigation of Illinois soils, C. G. Hopkins 1056
The soil of the Bermuda Islands: Its origin and composition, A. E. Verrill 1056
Nature of nitrogen compounds found at different depths in the soil, G. André 1056
The analysis of reh, the alkaline salts in Indian usar land, E. G. Hill 1056
Influence of soil on yield and composition of plants, O. Lemmermann 1056
Nitrification in different soils, W. A. Withers and G. S. Fraps 1056

FERTILIZERS.

Manures in use in Egypt, G. P. Foaden 1057
Preservation experiments with barnyard manure stored in heaps, Bachmann 1057
Valuation of unexhausted manures, J. A. Voelcker and A. D. Hall 1057
Effect of green manures plowed under at different times, Causemann 1058
Phosphorus versus lime in plant ash, P. Q. Keegan 1058
An unusual result of fertilizing on a sandy moor soil, Clausen 1058
Experiments with potash fertilizers on moor meadows, Bachmann 1058
Potash and alkaline phosphatic nitrogenous bone fertilizer, J. B. Sobrinho 1058
The manufacture of animal fertilizers 1058
Commercial fertilizers, H. A. Huston and W. J. Jones, jr 1058
Analyses of commercial fertilizers, W. C. Stubbs 1058
Inspection of fertilizers and miscellaneous analyses, F. W. Morse et al 1058
Some facts about commercial fertilizers in New York State, L. L. Van Slyke 1058
Fertilizer analyses, fall season, 1902, B. W. Kilgore 1059
Fertilizer analyses, spring season, 1903, B. W. Kilgore 1059
Analyses of commercial fertilizers, J. L. Hills and C. H. Jones 1059
Water in its relation to the fertilization of the soil, R. Onor 1059

FIELD CROPS.

Report of the agriculturist, A. H. Danielson 1059
Forage crops, grasses, alfalfa, clovers, etc., W. R. Dodson 1059
Experiments with phosphatic fertilizers in 1900–1901, O. Reitmair 1059
The progress of absorption of nitrogen by cereals, J. Henry 1060
Review of agricultural experiments, A. P. Aitken 1060
Corn experiments in Illinois 1060
The acidity of corn silage, F. W. Morse 1060
Cotton culture, R. J. Redding 1060
Cotton culture, J. S. Newman 1061
Peas and the pea weevil, C. A. Zavitz and W. Lochhead 1061
Experiments with oats, Aberdeen, 1901–2, J. Wilson and W. M. Findlay 1062
Sisal, the Yucatan fiber, E. H. Thompson 1062
Sugar-beet investigations in Illinois, C. G. Hopkins and L. H. Smith 1062
Macaroni wheat in South Dakota, E. C. Chilcott 1062
Wheat and milling, A. Girard and L. Lindet 1063

HORTICULTURE.

A selected list of vegetables for the garden, F. W. Rane 1063
Cultivation of vegetables and notes on varieties, G. Coote 1063
Report of the horticultural division, W. F. Massey 1063
Cucumbers under glass, G. E. Stone 1063
The origin of various varieties of American muskmelons, F. W. Rane 1064
Onion growing in the Cache la Poudre Valley, W. Paddock 1065
The tomato industry of the Arkansas Valley, H. H. Griffin 1065
Fertilizers for market-garden crops, B. Dyer 1066
Experiments in orchard culture, R. A. Emerson 1066
A study of Northwestern apples, N. E. Hansen 1068

Page.

Propagation of plums, third report, F. A. Waugh 1068
A review of Americana plums, F. A. Waugh 1069
The Japanese hybrid groups of plums, F. A. Waugh 1069
A résumé of what I know about my specialty—plums, J. W. Kerr 1069
Laying down of peach trees, W. Paddock 1069
A remarkable pineapple 1070
A remarkable mango 1070
Report of central station at Ames, H. C. Price 1070
An Iowa plant breeder; some of his creations, H. C. Price 1070
The influence of stock on scion, Leclerc du Sablon 1070
Hardiness of some grafted stocks, J. M. Guillon 1070
Comparative structure of calluses in grafted plants, L. Daniel 1070
Grafting nutmegs 1070
The white blackberry "Iceberg" 1071
Unfruitful currants, Ewert 1071
Grafts in moss, R. C. de Briailles 1071
Use of plaster in viticulture in connection with manures, L. Grandeau 1071
Direct shipments of grapes from Spain, A. E. Carleton 1071
Fertilizing by means of leguminous plants in tea culture, A. E. Kerkhoven 1072
Fruit-storage experiments 1072
Cold storage, H. T. Galpin 1072
Some remarks on the canning industry, W. B. Alwood 1073
Report of the Nova Scotia School of Horticulture, F. C. Sears 1073
The American carnation; how to grow it, C. W. Ward 1073
Breeding hybrid carnations, C. W. Ward 1073
The fertilization of chrysanthemum flowers 1074
Soil for blue hydrangeas, E. André 1074
Blue hydrangeas 1074
Nicotiana hybrids of the second generation, G. Bellair 1074
Etherization and chloroforming of dormant plant parts, W. Johannsen 1074
A woman's hardy garden, Helena R. Ely 1075
How to make school gardens, H. D. Hemenway 1075
The nature study idea, L. H. Bailey 1075

FORESTRY.

A German method of oak reproduction, W. F. Hubbard 1075
The cultivation of the locust tree, L. R. Jones and W. J. Morse 1076
The black walnut, G. O. Greene 1076
Notes on *Pseudotsuga glaucescens*, G. Bellair 1076
A research on the eucalypts, R. T. Baker and H. G. Smith 1076
A revision of the genus Eucalyptus—I, J. H. Maiden 1076
Progress in national forestry, J. S. Peyton 1076
Recent forest reserve consolidation 1076
Forestry for southern New England wood lots, R. T. Fisher 1077
Forestry at an experiment station, W. Mulford 1077
The farm wood lot in Michigan, F. G. Miller 1077
Minnesota's system of preventing forest fires, C. C. Andrews 1077
Profitable trees for planting on waste lands in New Jersey, F. R. Meier 1077
Forestry in Ohio, W. R. Lazenby 1078
Conservative lumbering at Sewanee, Tennessee, J. Foley 1078
Evidence taken on British forestry 1078
Report of the Philippine forestry bureau, 1901–2, G. P. Ahern 1079
Progress report of the forest surveys in Bengal, 1901–2, P. J. Gordon 1079
The production of timber in Algeria, J. Trabut 1079
The forester and the lumberman, G. Pinchot 1080
A profitable cutting of insect-killed timber, A. Cary 1080
Preservation of soil fertility in plantations, A. C. Forbes 1080
Shade tree suggestions, A. Nelson 1080
Creosoting timber, S. W. Labrot 1080

SEEDS—WEEDS.

Timothy, alsike, and red clover seeds, G. H. Clark 1080
Seed-testing stations in Hungary, J. Speir 1081
Rules for seed examinations adopted by Danish seed control stations 1081

Page.
Influence of remedies for smut on the germination of seeds, B. Mezentzov.... 1081
On the influence of salt water on the viability of seeds, O. Rostrup 1081
On the viability of seed buried in the ground, O. Rostrup..... 1081
On the viability of weed seed, O. Rostrup..... 1082
Notes on weeds, W. Carruthers..... 1082
Killing weeds in lawns, L. R. Jones and W. J. Morse..... 1082

DISEASES OF PLANTS.

Report of the vegetable pathologist, D. McAlpine 1082
The diseases of cultivated plants, G. Delacroix 1082
Notes on some important plant diseases of the Tropics, F. Noack 1082
Notes on some plant diseases, K. Malkoff..... 1083
The distribution of the anthracnose of red clover, G. Linhart..... 1083
Investigations on cereal rusts, E. Marchal..... 1083
The treatment of stinking smut in wheat, J. Reed..... 1084
Potato diseases and their remedies, L. R. Jones and W. J. Morse..... 1084
Diseases of the potato in Ireland, T. Johnson 1085
Some diseases of the potato and of fruit trees, A. Linton 1085
A new fungus disease of potatoes, R. S. MacDougall 1085
A bacterial disease of sugar beets, G. G. Hedgcock and H. Metcalf..... 1085
Nematode diseases of bananas, sugar beets, etc., V. Mosseri..... 1086
Nematodes in out-of-door plants, A. Osterwalder..... 1086
Anagallis arvensis as a host for nematodes, Van Hall and Van Bijlevelt 1086
Some diseases of sugar cane in the West Indies, A. Howard 1086
The gummosis of the sugar cane, R. G. Smith..... 1086
An ascobacterium from the sugar cane, R. G. Smith 1086
A gum-forming bacterium from *Eucalyptus stuartiana*, R. G. Smith..... 1087
The bacterial origin of gums of the arabin group, R. G. Smith..... 1087
Cucumber diseases, G. E. Stone 1087
Orchard diseases and their remedies, L. R. Jones and W. J. Morse 1087
A destructive apple rot following scab, H. J. Eustace 1088
Botanical investigations on fruit diseases..... 1088
Spraying for bitter rot 1088
Apple canker, F. C. Sears..... 1089
Laboratory of vegetable physiology and fermentations, H. Müller-Thurgau... 1089
Two diseases of vanilla, G. Delacroix 1089
The gooseberry mildew in Europe, E. S. Salmon 1089
The distribution of the gooseberry mildew in Russia, P. Hennings..... 1090
Chemical and physiological studies on the mulberry dwarf disease, U. Suzuki.. 1090
Diseases of trees and plants, W. Carruthers 1090
Æcidium elatinum as the cause of witches' brooms of silver fir, E. Fischer..... 1090
Perithecial forms of *Phleospora ulmi* and *Glœosporium nervisequum*, H. Klebahn.. 1090
A disease of lilacs caused by *Botrytis vulgaris*, C. J. J. Van Hall..... 1090
Some pests of the flower garden, M. C. Cooke 1090
A disease of the carnation, M. C. Potter..... 1090
The treatment of fungus pests, A. Howard 1091
Annual review of literature relating to plant diseases, 1901, M. Hollrung 1091

ENTOMOLOGY.

Fifteenth annual meeting of the Asssociation of Economic Entomologists..... 1091
Report of the entomologist, C. P. Gillette..... 1092
Report of the State entomologist, A. L. Quaintance..... 1093
Principal injurious insects of the year, A. L. Quaintance and R. I. Smith..... 1093
Report of the entomologist, C. French 1093
Annual report for 1902 of the zoologist, C. Warburton 1093
Orchard and bush fruit pests and how to combat them, C. Warburton 1093
Entomology, M. V. Slingerland 1093
Insects injurious to fruit trees, H. Faes 1093
Combating animal pests on fruit trees, grapevines, and vegetables, Hofer..... 1093
San José scale investigations, IV, V. H. Lowe and P. J. Parrott 1094
Orchard treatment for the San José scale, H. T. Fernald 1095
San José scale, E. D. Sanderson 1096

Page.
Canadian experience with lime, sulphur, and salt for scale, G. E. Fisher 1096
Notes on lime-sulphur-salt wash as an insecticide, C. W. Mally 1096
Insect enemies of the apple tree and its fruit, L. Bruner 1096
Tent caterpillars, W. N. Hutt 1096
A study of the parasites of the American tent caterpillar, W. F. Fiske 1096
Grapevine-root worm, E. P. Felt 1096
Some diseases of the potato and of fruit trees, A. Linton 1097
Sugar-cane borers—insecticides and fungicides, P. Bonâme 1097
Cabbage-root maggots, G. H. Carpenter 1097
Australian ladybird beetles, W. W. Froggatt 1097
The flea beetles, A. C. Jensen 1097
Screw worms in St. Lucia, St. G. Gray 1097
New Geometridæ and Microlepidoptera from the European faunal region, A. Fuchs 1097
Hymenoptera of Valais, E. Frey-Gessner 1098
On the Hymenoptera collected by Mr. Robert Shelford at Sarawak, P. Cameron
The wharf-borer (*Nacerdes melanura*), T. Broun 1098
Parasites of *Oiketicus platensis*, C. Schrottky 1098
Metamorphoses of *Uroplata costipennis*, J. Brèthes 1098
Contribution to a knowledge of the Rutelidæ, F. Ohaus 1098
On some parasites of *Xylocopa tenuiscapa*, E. E. Green 1098
Nursery inspection, C. M. Weed 1098
The effects of drought upon insect life, Mary E. Murtfeldt 1098
Lantern trapping, E. J. Smith 1098
Spray calendar 1098
Insecticides and fungicides, A. B. Cordley 1099
Paris green, W. C. Stubbs 1099
Contribution to the knowledge of Anopheles, W. Dönitz 1099
The structure and biology of *Anopheles maculipennis*, G. H. F. Nuttall and A. E. Shipley 1099
Characters of some mosquito larvæ, J. B. Smith 1099
Notes on the early stages of *Culex canadensis*, J. B. Smith 1099
Selecting the locality for an apiary, R. Beuhne 1099
A scent-producing organ in the abdomen of the honey bee, F. W. L. Sladen .. 1099

FOODS—NUTRITION.

Experiments on the metabolism of nitrogen in man, E. Landergren 1099
Concerning the metabolism of phosphorus in adult man, R. Ehrström 1100
Excretion of carbon dioxid during positive muscular work, J. E. Johansson and G. Koraen 1100
Ease and rapidity of digestion of meats, H. S. Grindley and T. Mojonnier 1100
Calorimetric examinations of milk, A. Schlossmann 1101
The technique of calorimetric analytical methods, A. Schlossmann 1101
Infant feeding 1101
The value of macaroni wheat for bread making, E. C. Chilcott 1101
The chemical and milling properties of macaroni wheat, J. H. Shepard 1101
Impurities in American wheat, A. L. Winton 1101
Composition and digestibility of Norwegian flat bread, S. Torup and P. W. K. Böckmann 1102
Aids to bread making, O. von Czadek 1102
The baker's book, E. Braun 1102
Chemical composition of cooked vegetable foods, Katharine I. Williams 1102
Asphodelus tenuifolius, an Indian famine food, A. Ghose 1102
The examination and utilization of horse-chestnuts, Laves 1102
Concerning sulphured dried fruit, A. Beythien and P. Bohrisch 1102
Coffee substitutes 1102
Pineapple wine, A. Salles 1102
Pineapple wine, H. Neuville 1102
Food adulteration in Wyoming, E. E. Slosson 1102
Report on examination of foods, drugs, and water supplies, R. O. Brooks 1103
National association of State dairy and food departments 1103
The household food supply of the United Kingdom, R. E. Turnbull 1103
Relations of population and food products in United States, J. H. Blodgett ... 1103
The food factor in education 1103
Text-book of hygiene, M. Rubner 1103

ANIMAL PRODUCTION.

	Page.
Variation in animals and plants, H. M. Vernon	1103
Practical manual of animal feeding, R. Dumont	1104
The inspection of feeding stuffs in 1902, F. W. Morse	1104
Using vine prunings and grape marc with molasses, L. Grandeau	1104
By-products used in the manufacture of molasses feeds, L. Grandeau	1104
Preparation and use of molasses bread for cattle feeding, G. Malet	1104
Keeping qualities of peat-meal-molasses feeds, A. Herzfeld, et al	1104
Digestibility of absorbents in molasses feeds, O. Kellner et al	1104
The protein of ground whale flesh, A. Kavli	1104
The energy of growth and lecithin in decoctions of cereals, M. Springer	1104
Concerning the glucose and proteid material of a ration, L. Duclert	1105
The influence of hydroxile ions on tryptic digestion, A. Kanitz	1105
Mineral, combined, and organized phosphorus in animal tissues, A. L. Percival	1105
Phosphates in the feeding of animals, A. Gouin and P. Andouard	1105
Cassava as a feed stuff, J. C. Brunnich and W. Maxwell	1105
Home produce *v.* purchased food, J. A. Voelcker	1106
Gains made by steers on pasturage, H. W. Mumford	1106
Feeds supplementary to corn for fattening steers, H. W. Mumford	1106
Live stock investigations, H. W. Mumford	1108
"Cremaval" and skim milk in feeding calves, C. Moser and J. Käppeli	1108
Sheep breeding, R. Doyle	1108
Economy of roots in sheep feeding, J. A. Voelcker	1108
Sugar beet as food for sheep	1109
Angora goats in Australia	1109
Growth of suckling pigs on skimmed cow's milk, M. B. Wilson	1109
Measures for increasing pig raising, O. Knispel	1109
The management of swine, L. Price	1110
Molasses as a food for horses, G. H. Berns	1110
Feeding experiments with horses: "Pail-mel" and maize, L. Grandeau	1110
Nutritive value of "Pail-mel," a molasses feed, L. Grandeau	1110
Handbook of horse raising, L. Born and H. Möller	1110
Horse raising in the Rhine countries in the light of statistics, Oldenburg	1110
Poultry division report, D. D. Hyde	1111
Profitable poultry farming, F. C. Hare	1111
Experiments in artificial incubation	1111
The spoiling of hens' eggs preserved in wood ashes, H. Svoboda	1111
The history of geese, J. J. McCue	1111
Ducks, G. Rogeron	1111

DAIRY FARMING—DAIRYING.

Feeding trials with cows, J. L. Hills	1111
A comparison of feeding trial methods, J. L. Hills	1112
Records of the station herd for 1900–1 and for 1901–2, J. L. Hills	1112
Comparison of score-card judgments and milk and butter records, J. L. Hills	1112
The effect of feed on the quality of butter, J. H. Hills	1112
The change from barn to pasture, J. L. Hills	1113
Dairy conditions and suggestions for their improvement, W. J. Fraser	1113
Dairy investigations, W. J. Fraser	1113
Variations in the composition of cows' milk, H. Ingle	1113
Ayrshire herd tests, F. W. Morse	1114
The milk supply of London, M. Beau	1115
Diminution of the content of lecithin in heated milk, Bordas and Raczkowski	1115
The watery content of creamery butter, H. E. Alvord	1115
The relation of carbon dioxid to proteolysis in the ripening of Cheddar cheese, L. L. Van Slyke and E. B. Hart	1115
Seventeenth annual meeting of the Granite State Dairymen's Association, 1901	1115
Officials, associations, and educational institutions connected with the dairy interests of the United States for the year 1903	1116

VETERINARY SCIENCE AND PRACTICE.

The first Norwegian veterinary meeting	1116
Report of chief veterinary inspector J. G. Rutherford	1116
Report of the city veterinarian, W. W. Richards	1117

Page

Work of the biological laboratory, D. C. Worcester 111
Bacterial diseases of animals, E. Thierry 111
Microbes and diseases of farm stock, J. Dunstan 111
The nursing of veterinary patients, H. A. Woodruff 111
Theories of immunity and their clinical application, A. S. Grunbaum 111
Antitoxic power of the organism and tissues toward poisons, G. Angelici 111
Study of inflammatory neomorphs in connective tissue, A. Maximow 111
General histological technique, H. Zangger 111
Vasogen preparations in veterinary practice, A. Höijer 111
Silver therapy, Dorn 111
Present status of photo-therapy and its application, I. I. Neimann 111
Treatment of malignant edema with carbolic acid, C. F. Dawson 111
Accidents following upon preventive inoculation, V. Galtier 111
Relationship of human tuberculosis to that of bovines, D. J. Hamilton 111
Transmission of human tuberculosis to cattle, C. O. Jensen 112
On the infectivity of the milk of tuberculous cows, Lydia Rabinowitsch 112
Milk from tuberculous cows, J. M. Young 112
Use of the meat and milk of tuberculous animals as food, L. del Rio 112
The Public Health (Scotland) Act, 1897, J. Henderson 112
Cerebral tuberculosis, G. Nuvoletti 112
Extracts of tubercle bacilli and other tuberculins, L. Guinard 112
Variations in the virulence of different cultures of tubercle bacilli, D. Veszprémi 112
Treatment of parturient paresis with iodid of potash, L. Misier 112
Treatment of parturient paresis, J. N. Ries 112
Infusion or injection in parturient paresis, J. Vlaskamp 112
Parturient paresis and apoplectic puerperal septicemia, E. H. B. Gravenhorst 112
Foot-and-mouth disease, J. G. Rutherford 112
The apopletic form of foot-and-mouth disease, Chapellier 112
The latest recurrence of foot-and-mouth disease near Palermo, Griglio 112
Baccelli's treatment of foot-and-mouth disease, A. Cinti-Luciani 112
Foot-and-mouth disease and the method of Baccelli, V. Cantoni 112
Aspergillosis in cattle, A. Quaranta 112
Differential diagnosis of blackleg, K. D. Malinovski 112
Rinderpest in South Africa, D. Hutcheon 112
Texas fever among cattle in the Netherlands, D. A. de Jong 112
Cases of pulmonary and pharyngeal actinomycosis in cattle, J. Kowalewsky 112
Granulous contagious vaginitis in cows, P. Bergeon 112
Experimental studies on barbone disease of buffaloes, Blin and Carougeau 112
Barbone disease of buffalo in Indo-China, M. H. Schein 112
The pseudo-cattle plague of Indo-China, Carré 112
Bovine pasteurellosis in the Malay Peninsula, Carougeau 112
The bacillus of contagious abortion, H. Preisz 112
Abortion in cattle. Scours in new-born calves, L. Van Es 112
White scour and lung disease in calves, J. D. Stewart 112
Ichthyosis in calves, S. Zertzalov 112
Diseases in sheep, W. G. Dowling 112
Pasteurellosis and strongylosis of sheep, J. Lignières 112
The vaccination of Algerian sheep against sheep pox, E. Nocard 112
Swine erysipelas serum, L. Deutsch 112
The control of swine erysipelas, A. van Leeuwen 112
Combating swine erysipelas, J. J. Wester 112
Serum diagnosis in hog cholera and swine erysipelas, E. Ercolani 112
Prophylaxis of hog cholera, A. Cinti-Luciani 112
A method of vaccinating against hog cholera according to Poels, H. Anker 112
Infectious catarrhal pulmonary inflammation in hogs, L. Greve 112
Third report on surra of cattle and horses in Togo, Schilling 112
The American surra or mal de caderas, F. Sivori and E. Lecler 112
The development of nagana and its variations, A. Laveran and F. Mesnil 112
Trypanosoma disease other than dourine in Algeria, M. Buffard and G. Schneider 112
Contribution to the serum diagnosis of glanders, M. A. Rabieaux 112
The use of antitetanic serum, A. Labat 112
Enzootic bulbar paralysis in horses, M. H. J. P. Thomassen 112
Pulmonary filariasis accompanying summer wounds, Droum 112
Filaria papillosa on the serous covering of the liver, N. Vuisotski 112
Cases of epizootic lymphangitis in horses, I. G. Usenkov 112
Parasitic dermatitis, Cadéac 112

Page.
Contribution to the study of botryomycosis, V. Lafargue 1128
The sting of *Bombus terrestris* and its symptoms in horses, R. Bissauge 1128
Botfly larvæ in the stomach of a horse, E. Perroncito 1128
Flatworms parasitic in domesticated animals, R. S. McDougall 1129
Poisonous properties of certain species of Equisetum, C. E. J. Lohmann 1129
Permanganate of potash in the treatment of ulcerous keratitis, B. Danou 1129
Preventive treatment for rabies in horses by rabies virus, A. Conte 1129
The histological diagnosis of rabies in dogs, A. Rabieaux 1129
Pseudorabies of dogs, A. Tomiolo 1129
Pseudo-tuberculosis in dogs, Ducourneau and P. Jayles 1129
Treatment of eczema in dogs, Pécus 1130
Effect of injection of micro-organisms into portal system, E. S. Carmichael 1130
An epizootic among guinea pigs caused by a coli bacillus, K. Kovárzik 1130
A new micro-organism which causes infection in animal pens, Schwer 1130
Determination of the value of fowl-cholera serum, F. H. Mosler 1130

Section of Foreign Markets:	
Circ. 25	1133

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.
